Factoid of the Day

The world's second-most valuable traded commodity, only behind petroleum.

Factoid of the Day

The world's second-most valuable traded commodity, only behind petroleum.

The first webcam was created at the University of Cambridge

What is it?

The last picture that the webcam ever took, showing a hand about to switch the server off.

STM32WB Introduction
BLE Basics
Tools & Firmware
Lot’s of Hands-On coding!

Agenda

8:00 Welcome and Tools install (if needed)

9:00 A few words..

Hands-On: Out-of-the-Box

Hands-On: CubeMX

BLE Basics

Hands-On: HRM

10:30 Break

Architecture

Hands-On: CubeMonitorRF

12:00 Lunch (1h)

1:00 More WB Detail

Hands-on: Cable replacement

Hardware considerations

2:15 Break

Hands-on: OTA Firmware Updates

2:45 Wrap-Up, Q&A, Survey

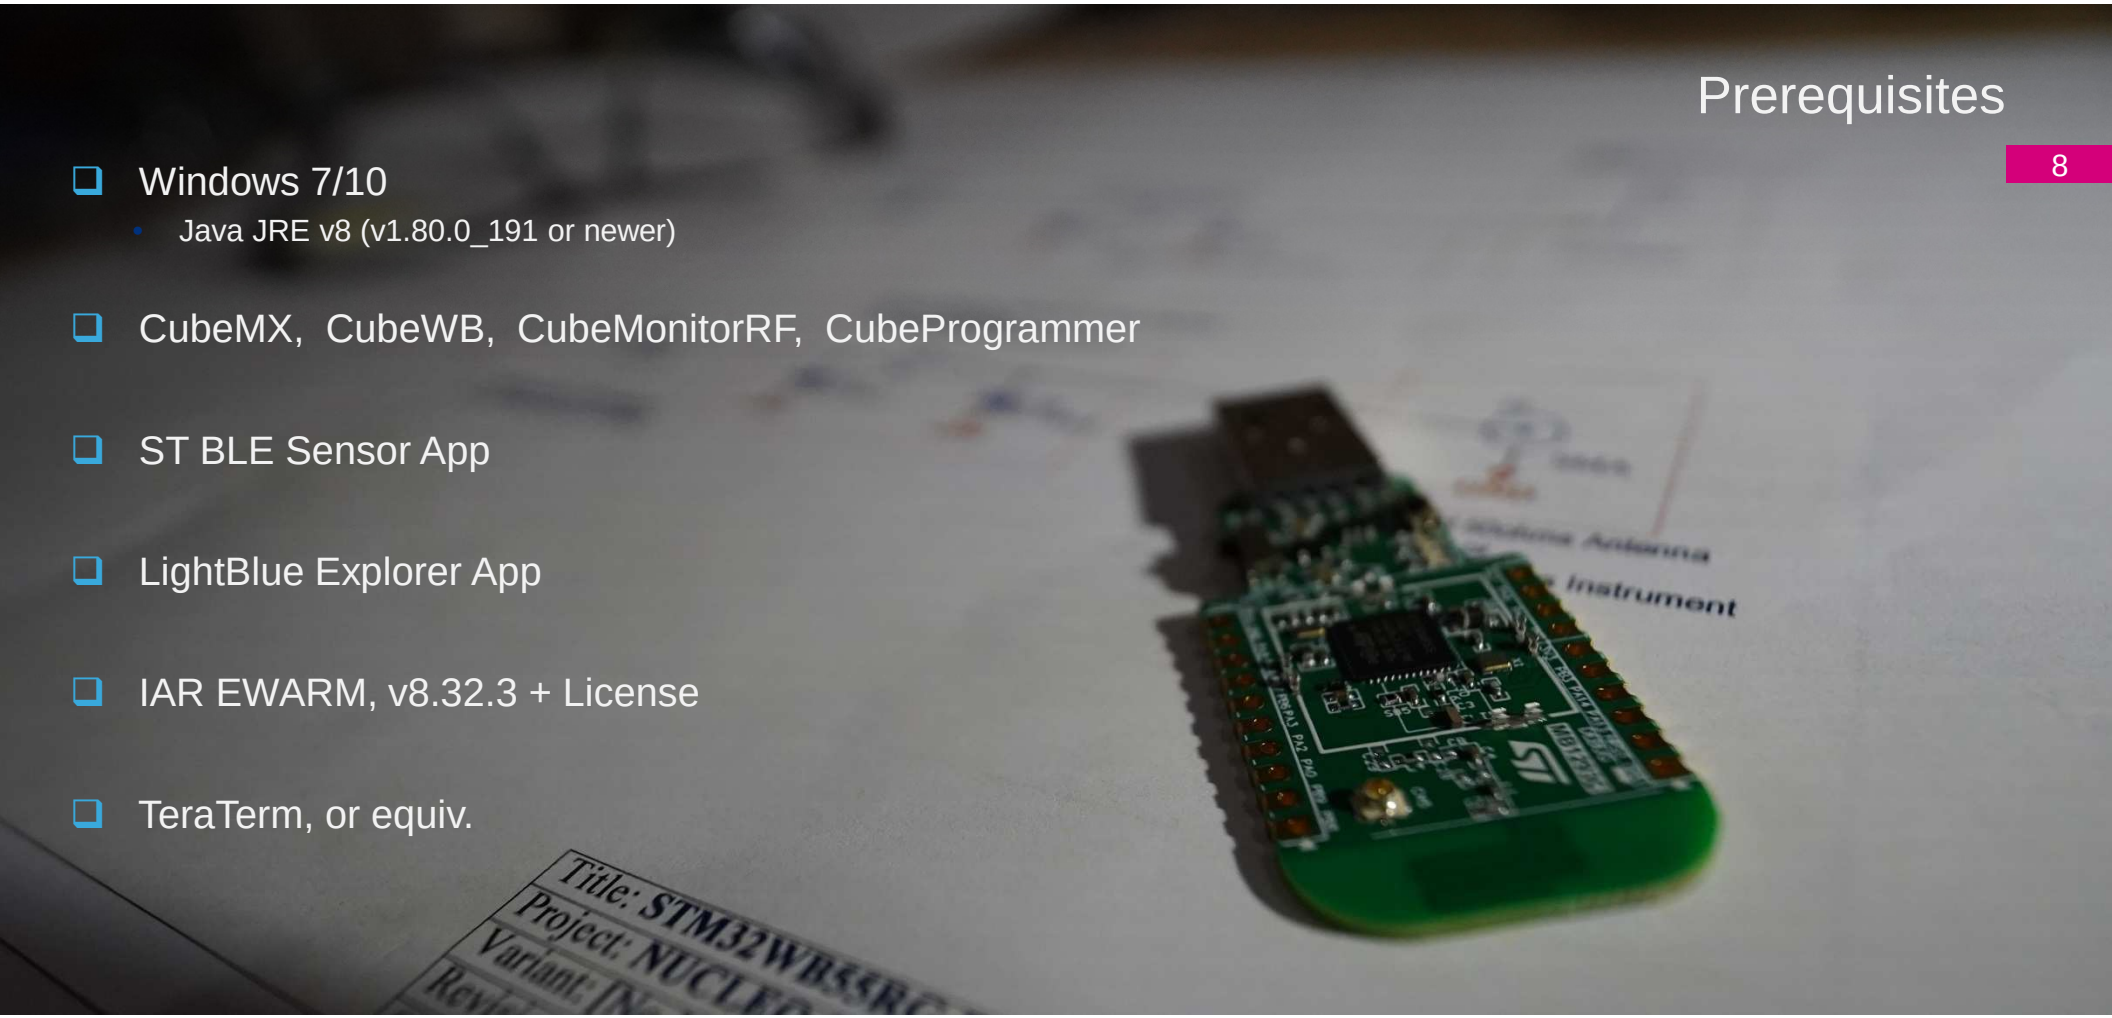
STM32 WB

Prerequisites

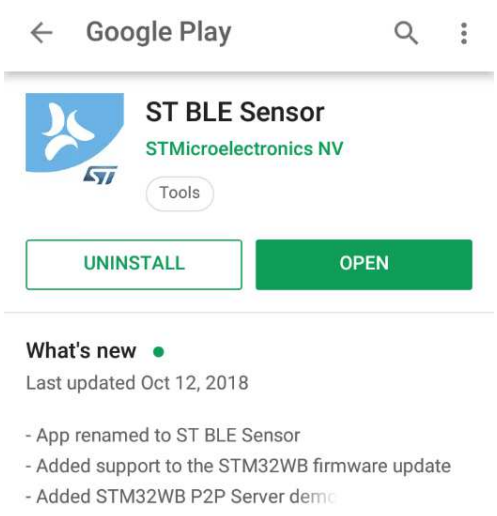
- Windows 7/10
  - Java JRE v8 (v1.80.0_191 or newer)
- CubeMX, CubeWB, CubeMonitorRF, CubeProgrammer
- ST BLE Sensor App
- LightBlue Explorer App
- IAR EWARM, v8.32.3 + License
- TeraTerm, or equiv.

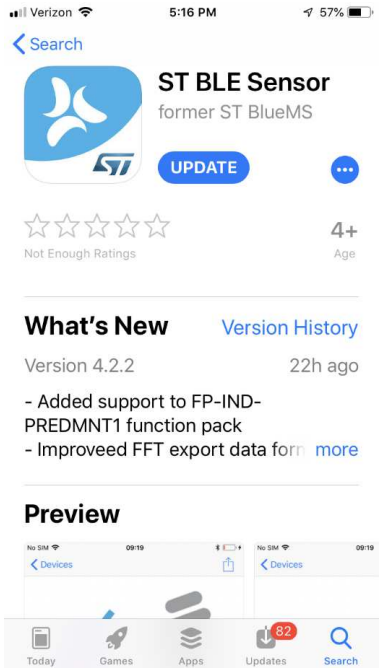


ST BLE Sensor app, v4.3

Play Store

App Store





life.augmented

STM32 WB

LightBlue Explorer

PunchThrough

LightBlue® | Explorer

The industry-leading BLE test app for iOS and Android. Used by over a half million people, LightBlue Explorer lets you scan, connect to and browse any nearby Bluetooth Smart device. Includes full support for logging data and simulating peripherals.

Download on the App Store

GET IT ON Google Play

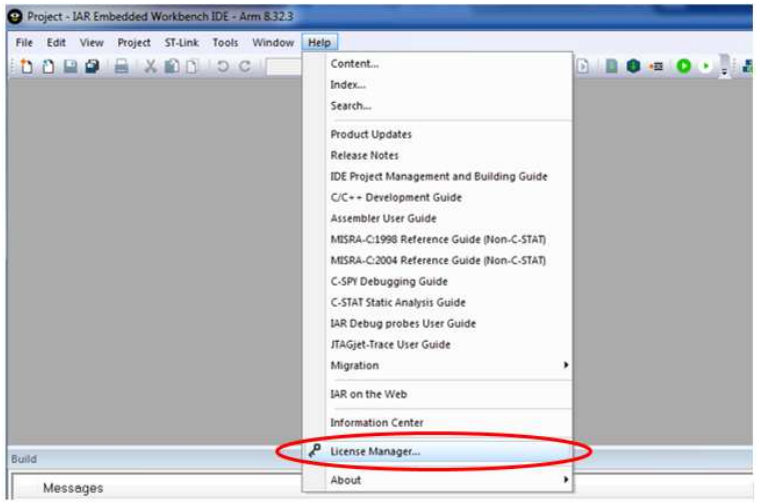
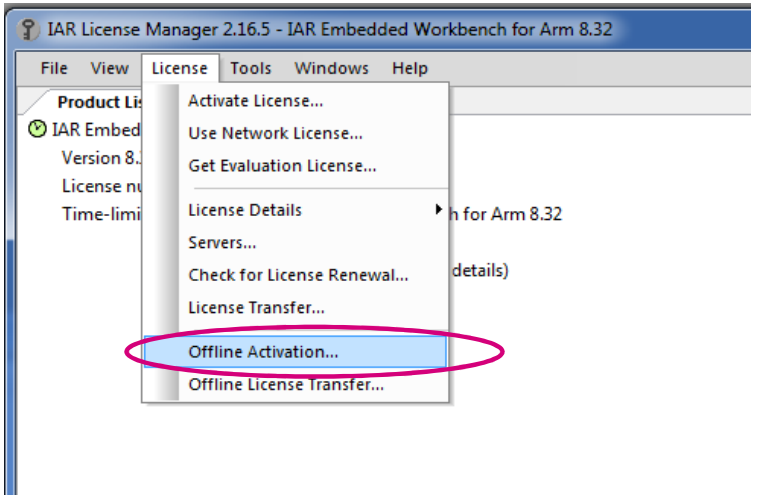
STM32 WB

IAR EWARM 8.32.3 - License Installation

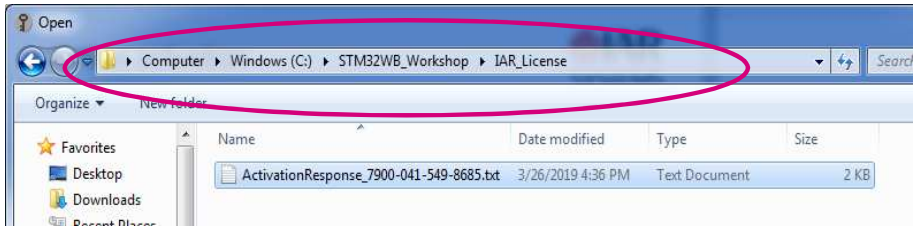
- Activate the time-limited evaluation license with Activation Response file included in the provided zip file
- From IAR Embedded Workbench, go to Help->License Manager
- From the License manager, go to License->Offline Activation

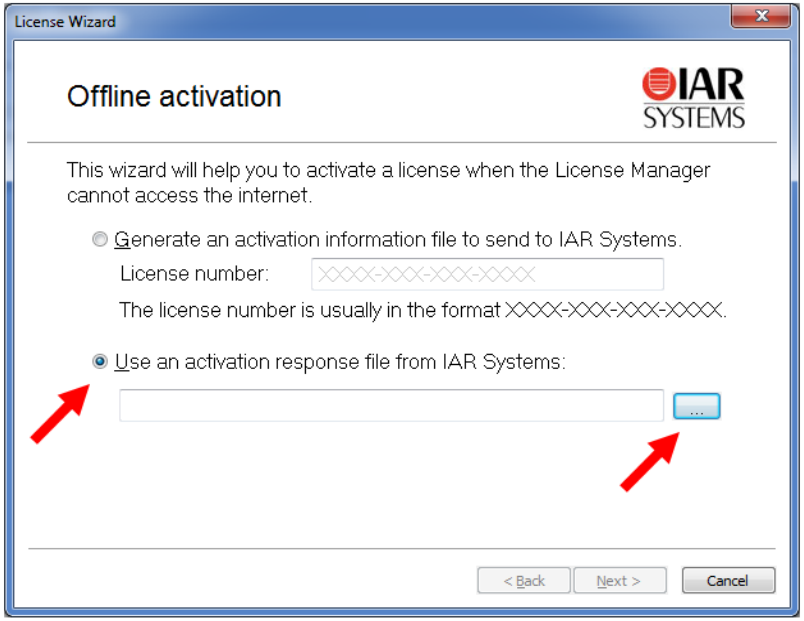




IAR EWARM 8.32.3 - License Installation

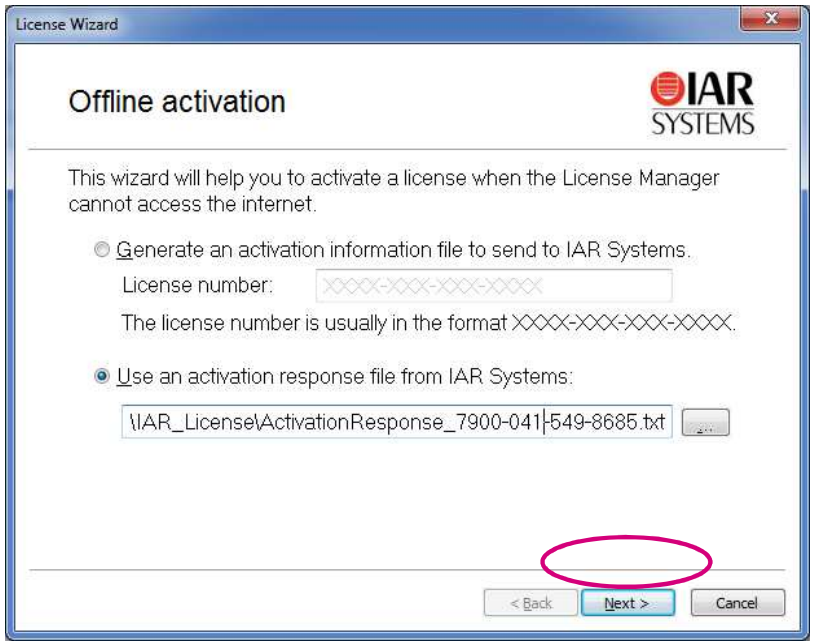
- Click “Use an activation response file from IAR Systems” option
- Search for the “ActivationResponse_7900-041-549-8685.txt” file





IAR EWARM 8.32.3 - License Installation

Click “Next”



Click “Done”

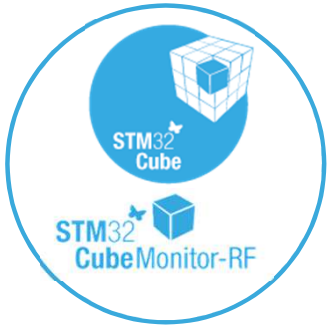
STM32WB Key Takeaways

Multi-protocol

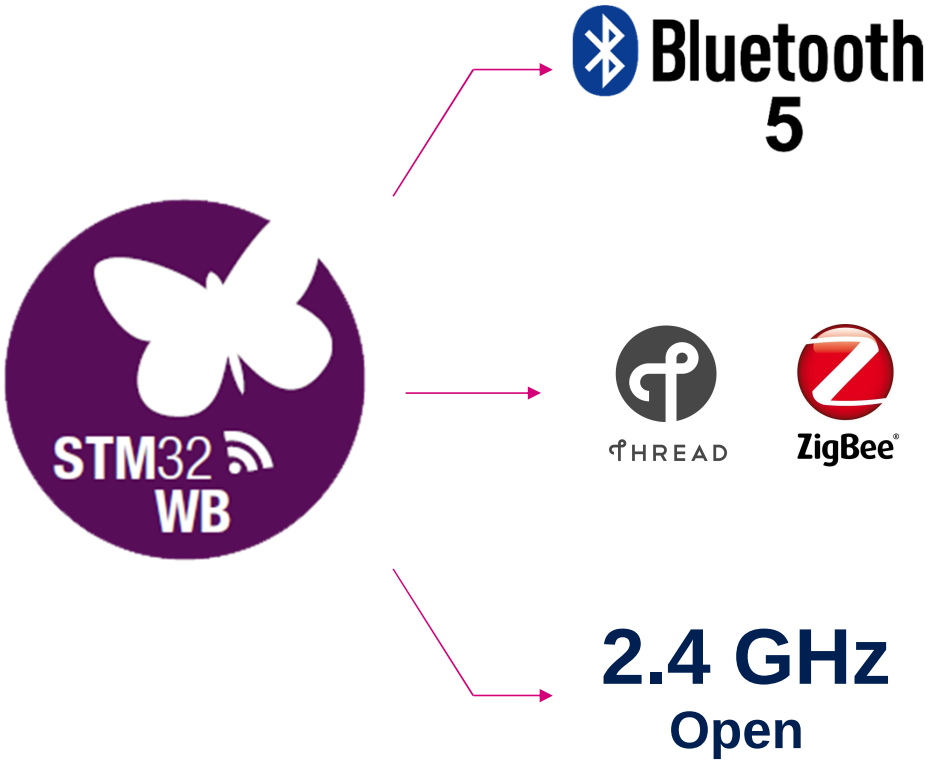
Dual-core
Ultra-Low Power

Secure



Comprehensive Ecosystem

Multiprotocol



Multiprotocol

Bluetooth 5

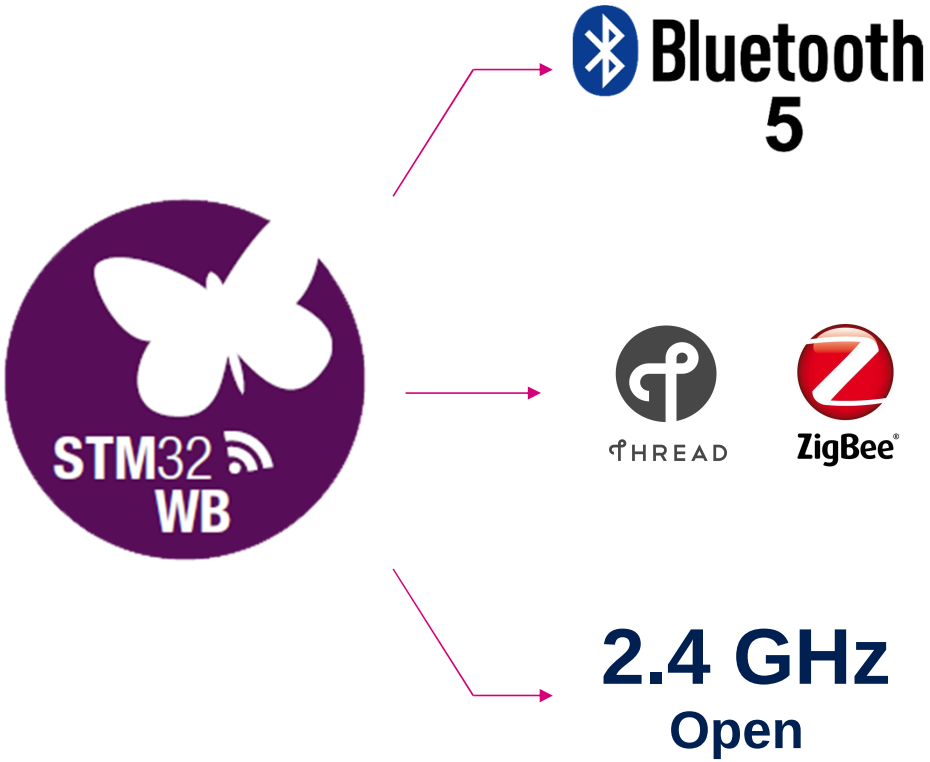
- Fully certified
- 2Mbps
- BLE Mesh

THREAD

ZigBee

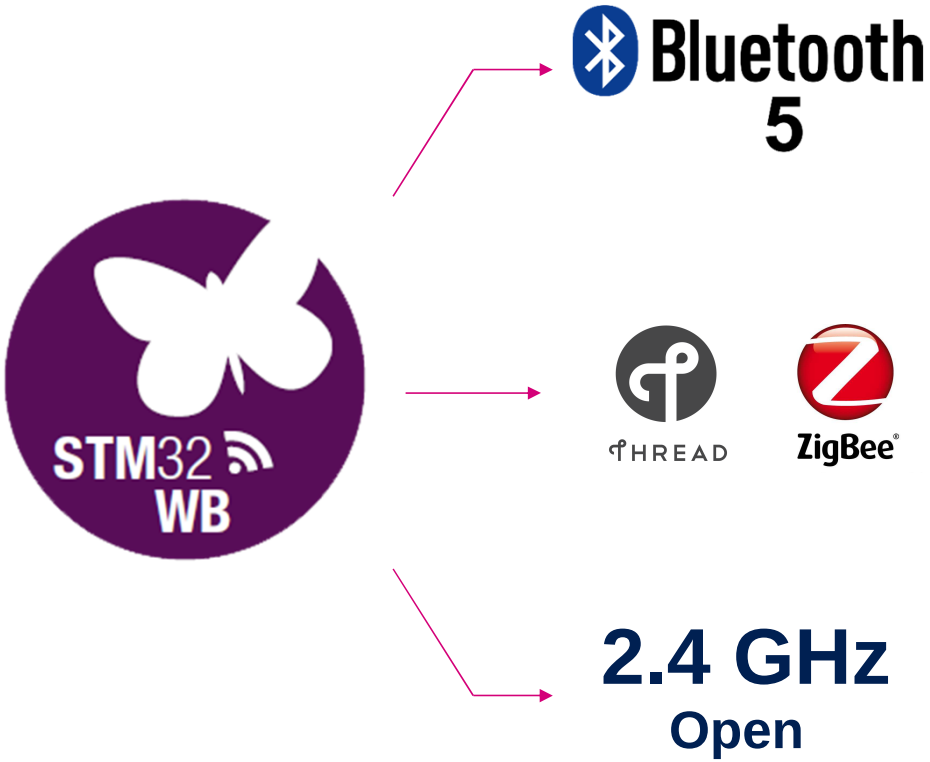
2.4 GHz
Open

Multiprotocol



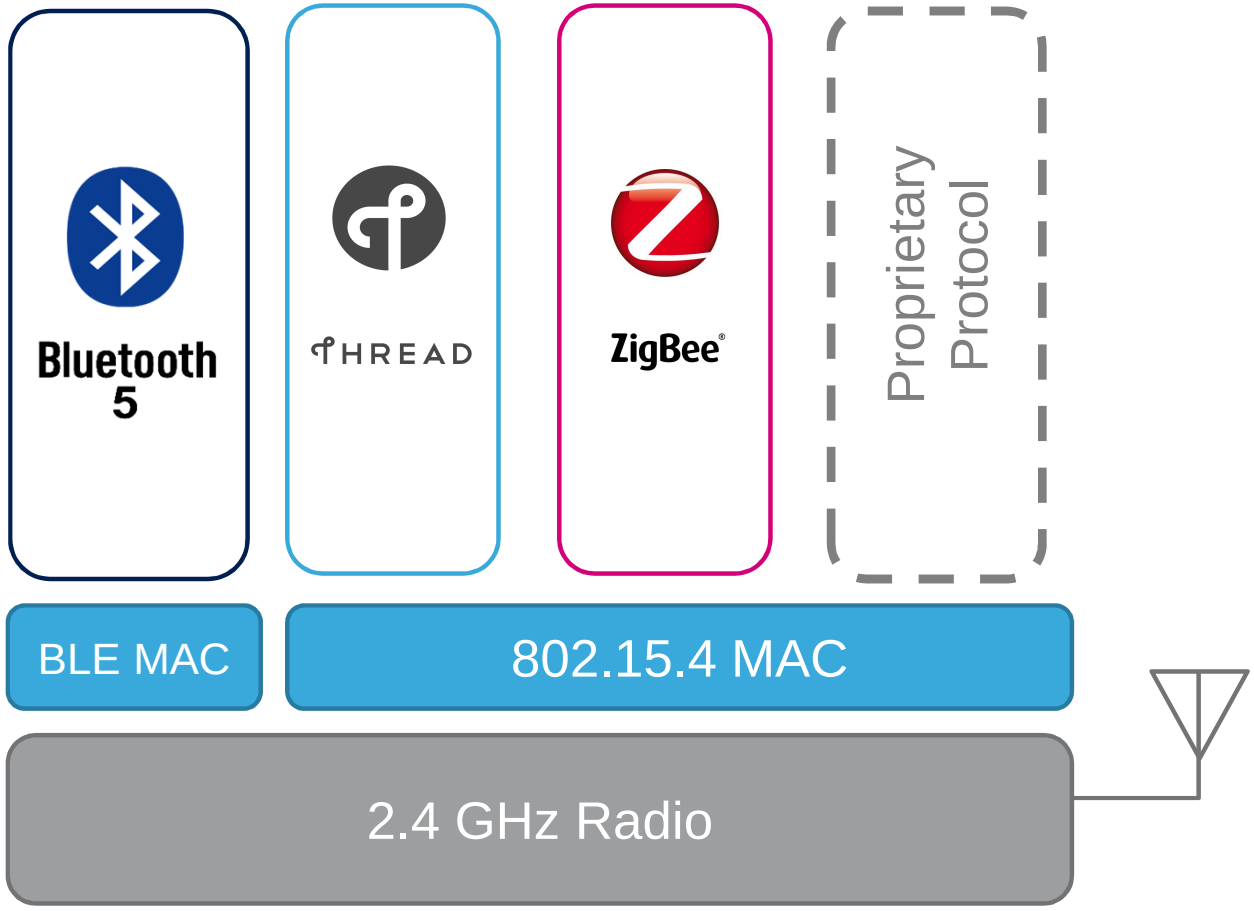
- Zigbee 3.0
- OpenThread
- Concurrent BLE + OpenThread

Multiprotocol



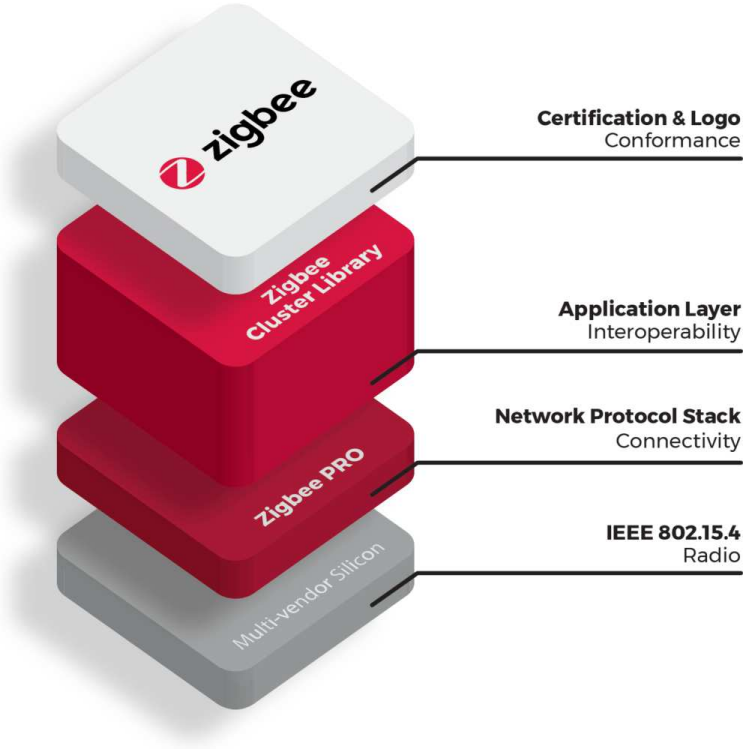
- OpenMAC

Stack + MAC + PHY



Zigbee 3.0 Stack

- Fully certified
- Legacy cluster support
- Revision R21 to R23
- Coming in late 2019



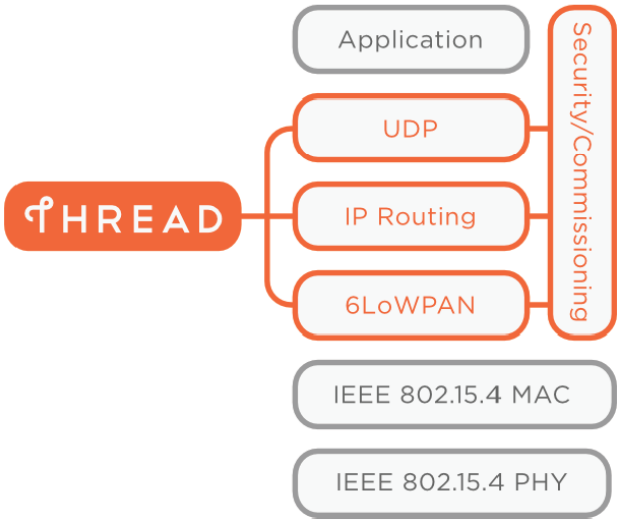
THREAD What it delivers

ST is member of Thread Group (Contributor level)

A secure wireless mesh network for your home and its connected products

- Built on well-proven, existing technologies
- Uses 6LoWPAN and carries IPv6 natively
- Runs on existing 802.15.4 silicon
- New security architecture to make it simple and secure to add / remove products
- 250+ products per network
- Designed for very low power operation
- Reliable for critical infrastructure

Can support many popular application layer protocols and platforms

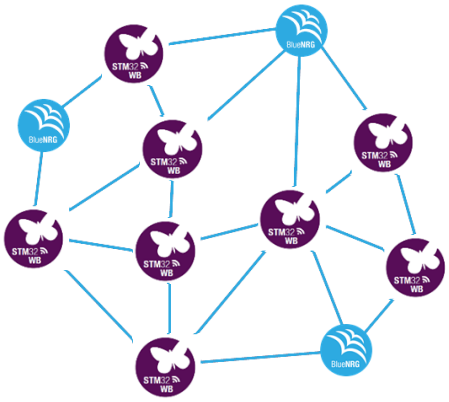


A software upgrade can add Thread to currently shipping 802.15.4 products

Bluetooth Mesh vs Thread

Bluetooth Mesh

- Based on Bluetooth 4.0 and later
- Broadcast type, flood the network with messages, no routing
- Shorter range, 3kbps application data rate, 1Mbps on air data rate
- High power consumption



Thread

- IPv6-based using 802.15.4 MAC
- Routing table approach with network self healing
- Medium range, 40Kbps application data rate, 250Kbps on air data rate
- Low power consumption

Integrated Development Environment for STM32

Get Software | Download databrief

Overview Tools & Software Resources

STM32CubeIDE is an all-in-one multi-OS development tool, which is part of the STM32Cube software ecosystem.

STM32CubeIDE is an advanced C/C++ development platform with IP configuration, code generation, code compilation, and debug features for STM32 microcontrollers. It is based on the ECLIPSE™/CDT framework and GCC toolchain for the development, and GDB for the debugging. It allows the integration of the hundreds of existing plugins that complete the features of the ECLIPSE™ IDE.

STM32CubeIDE integrates all STM32CubeMX functionalities to offer all-in-one tool experience and save installation and development time. After the selection of an empty STM32 MCU or preconfigured microcontroller from the selection of a board, the project is created and initialization code generated. At any time during the development, the user can return to the initialization and configuration of the IPs or middleware and regenerate the initialization code with no impact on the user code.

STM32CubeIDE includes build and stack analyzers that provide the user with useful information about project status and memory requirements.

STM32CubeIDE also includes standard and advanced debugging features including views of CPU core registers, memories, and peripheral registers, as well as live variable watch, Serial Wire Viewer interface, or fault analyzer.

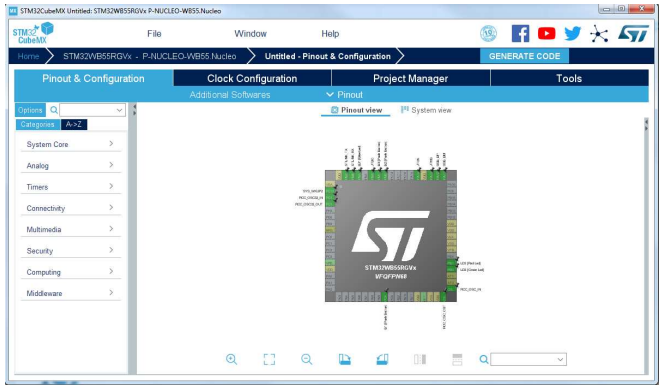
Your Magic number!

Hands-On

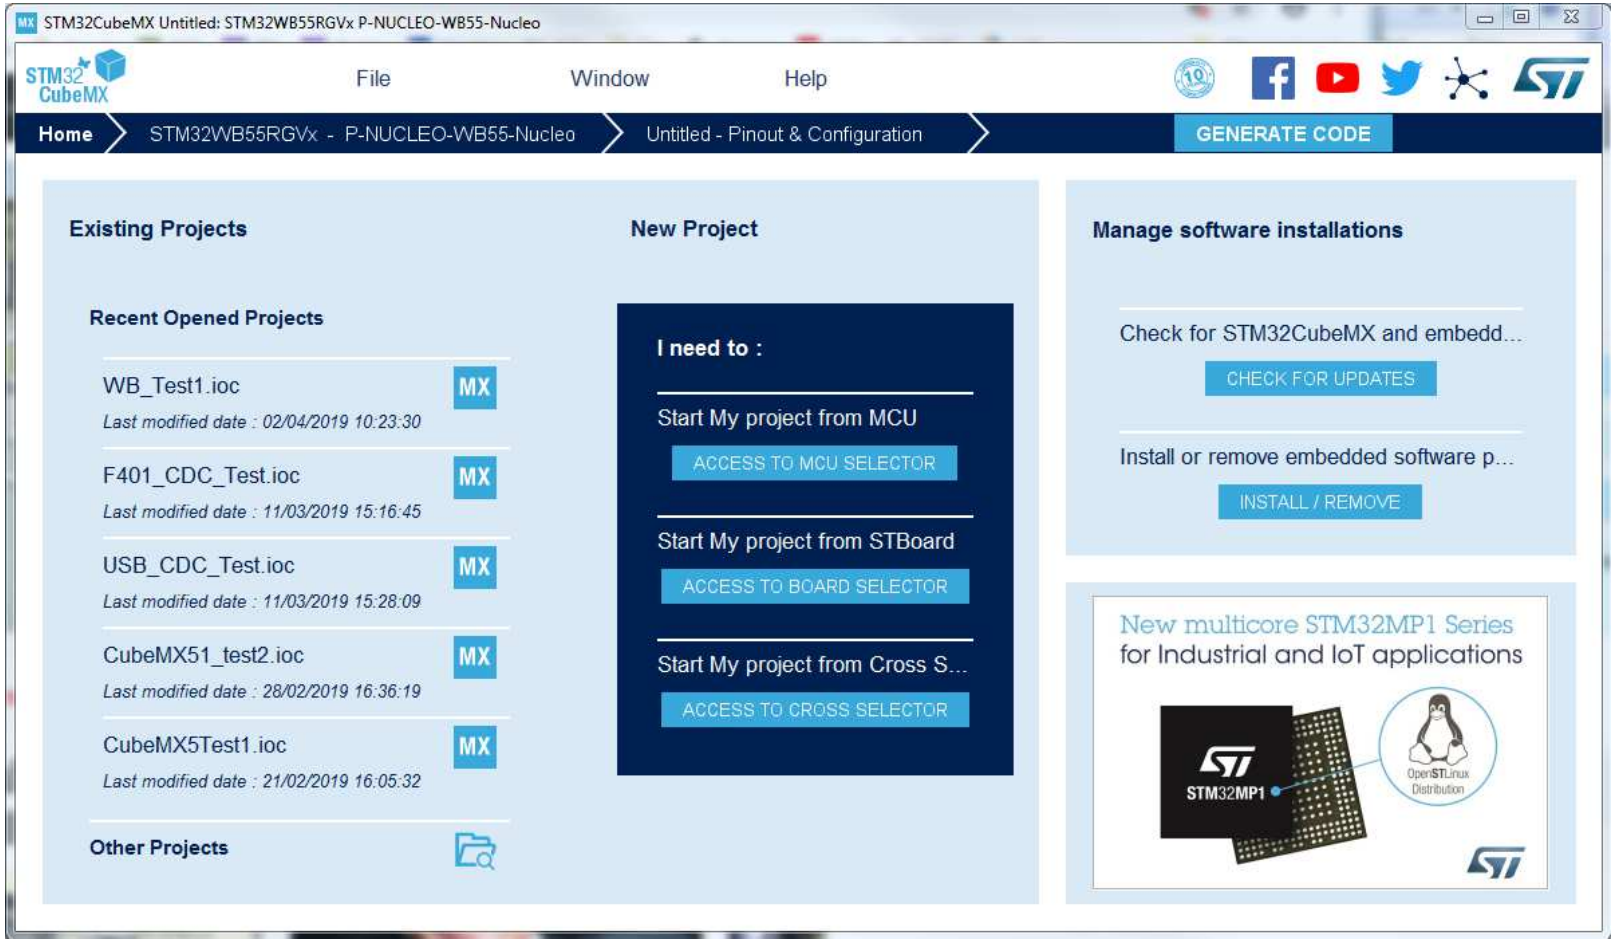
CubeMX



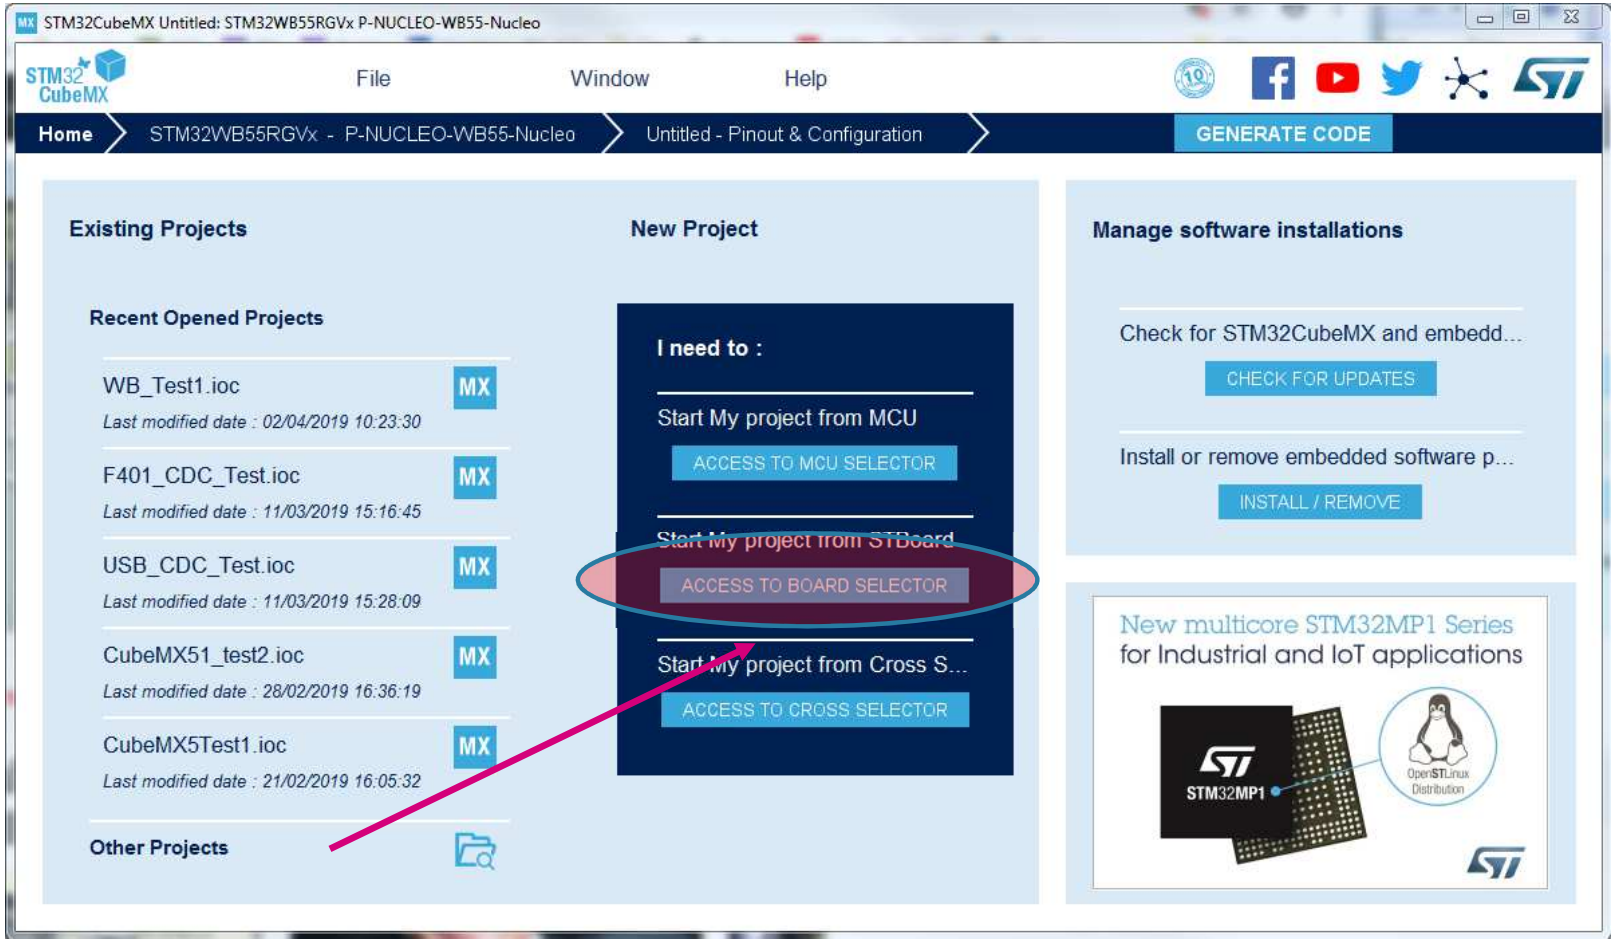
life.augmented

STM32 WB

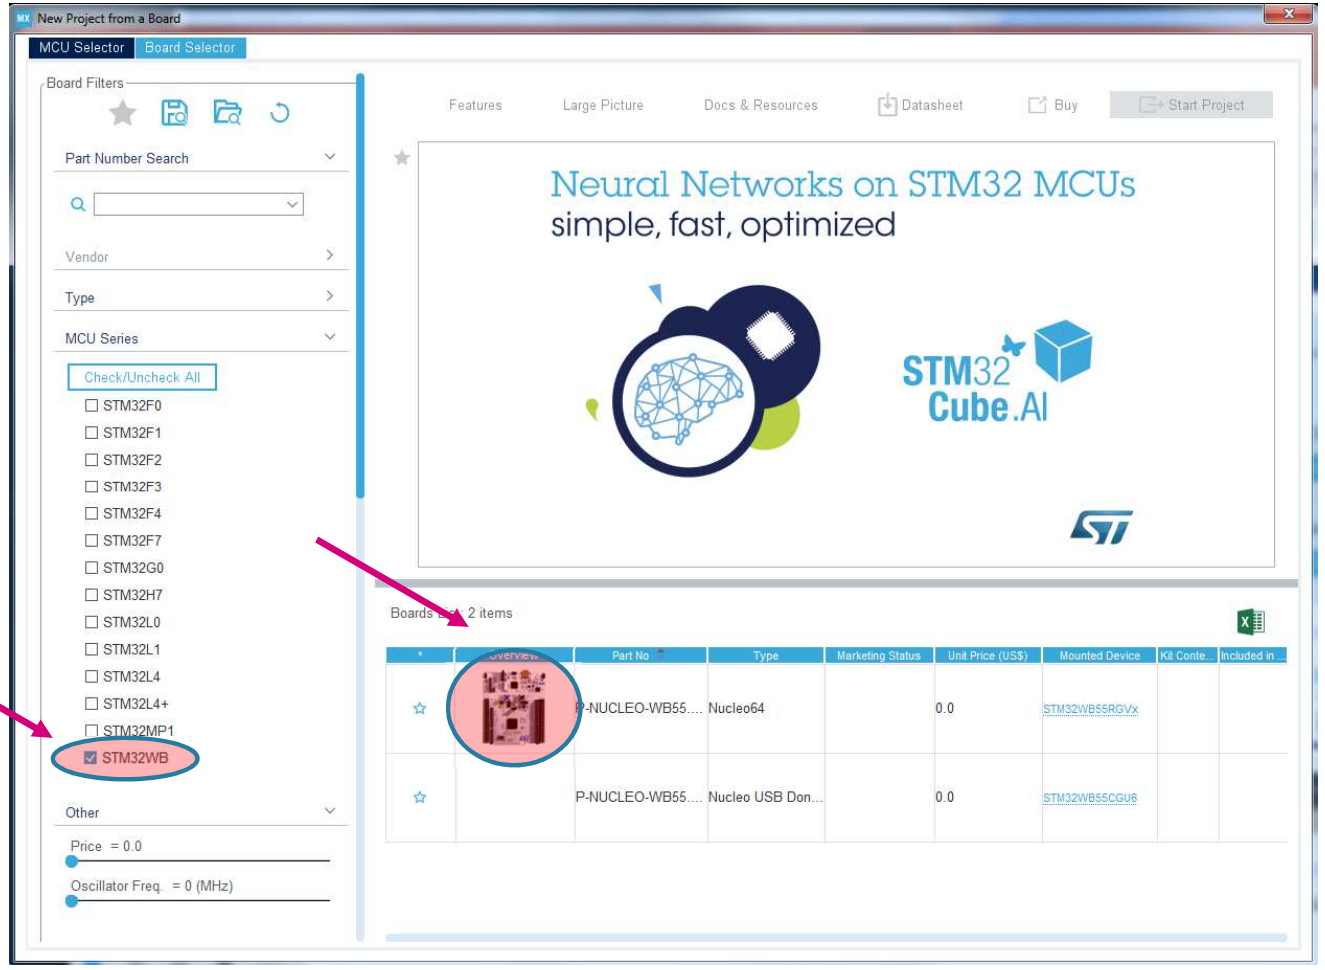
Launch CubeMX



Launch CubeMX & Start project from Board Selector



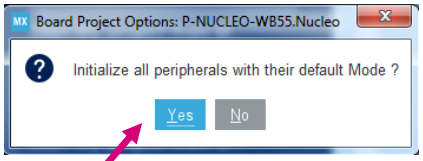
Filter by STM32WB and double-click on the Nucleo board!



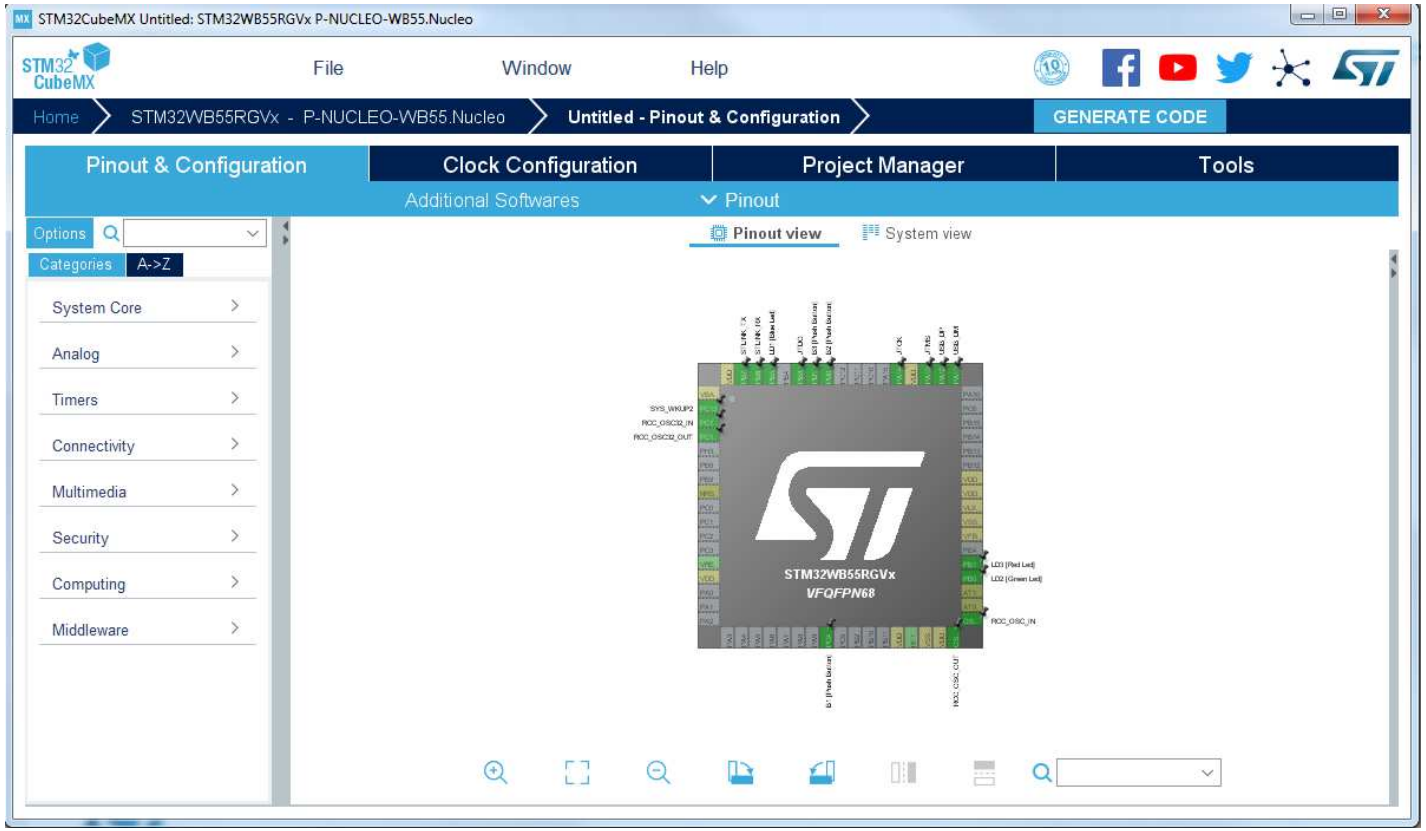
life.augmented

STM32 WB

P-NUCLEO-WB55 Board Project

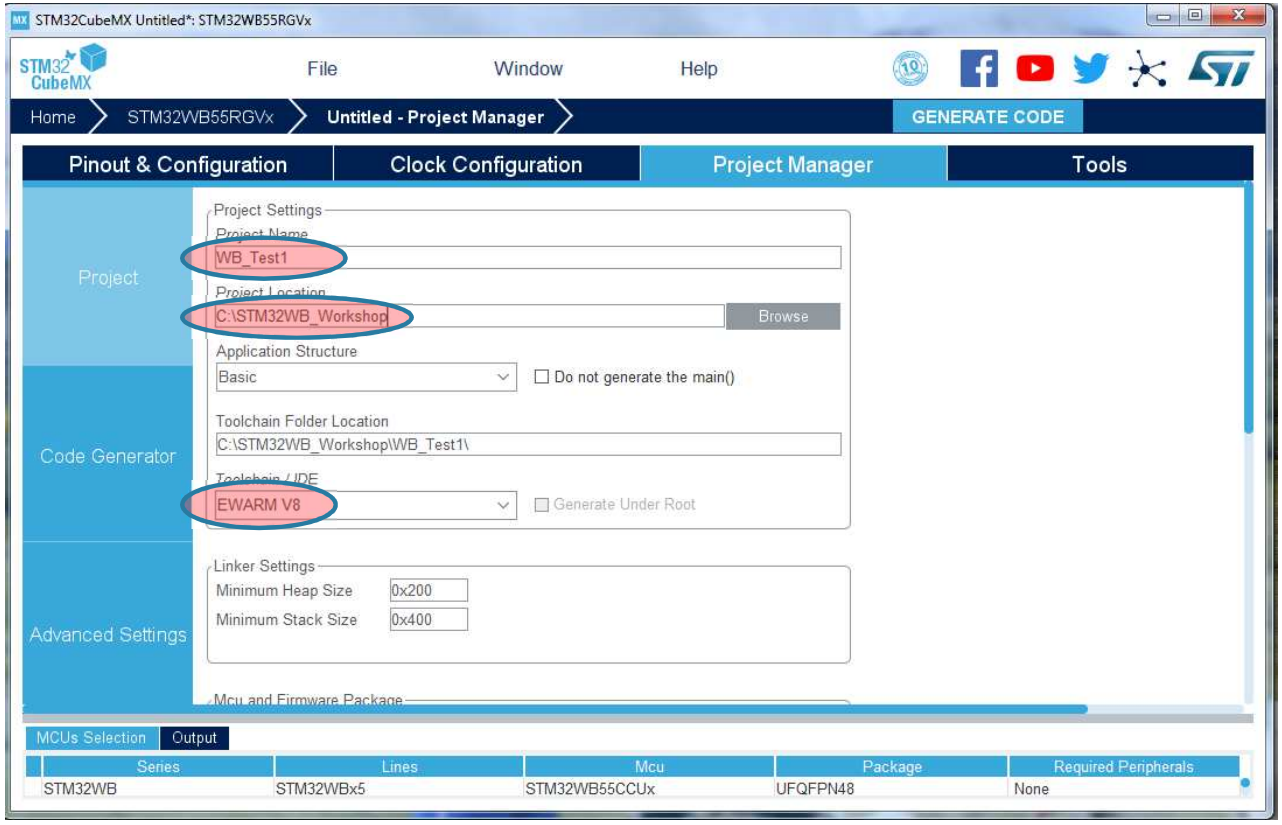


Yes

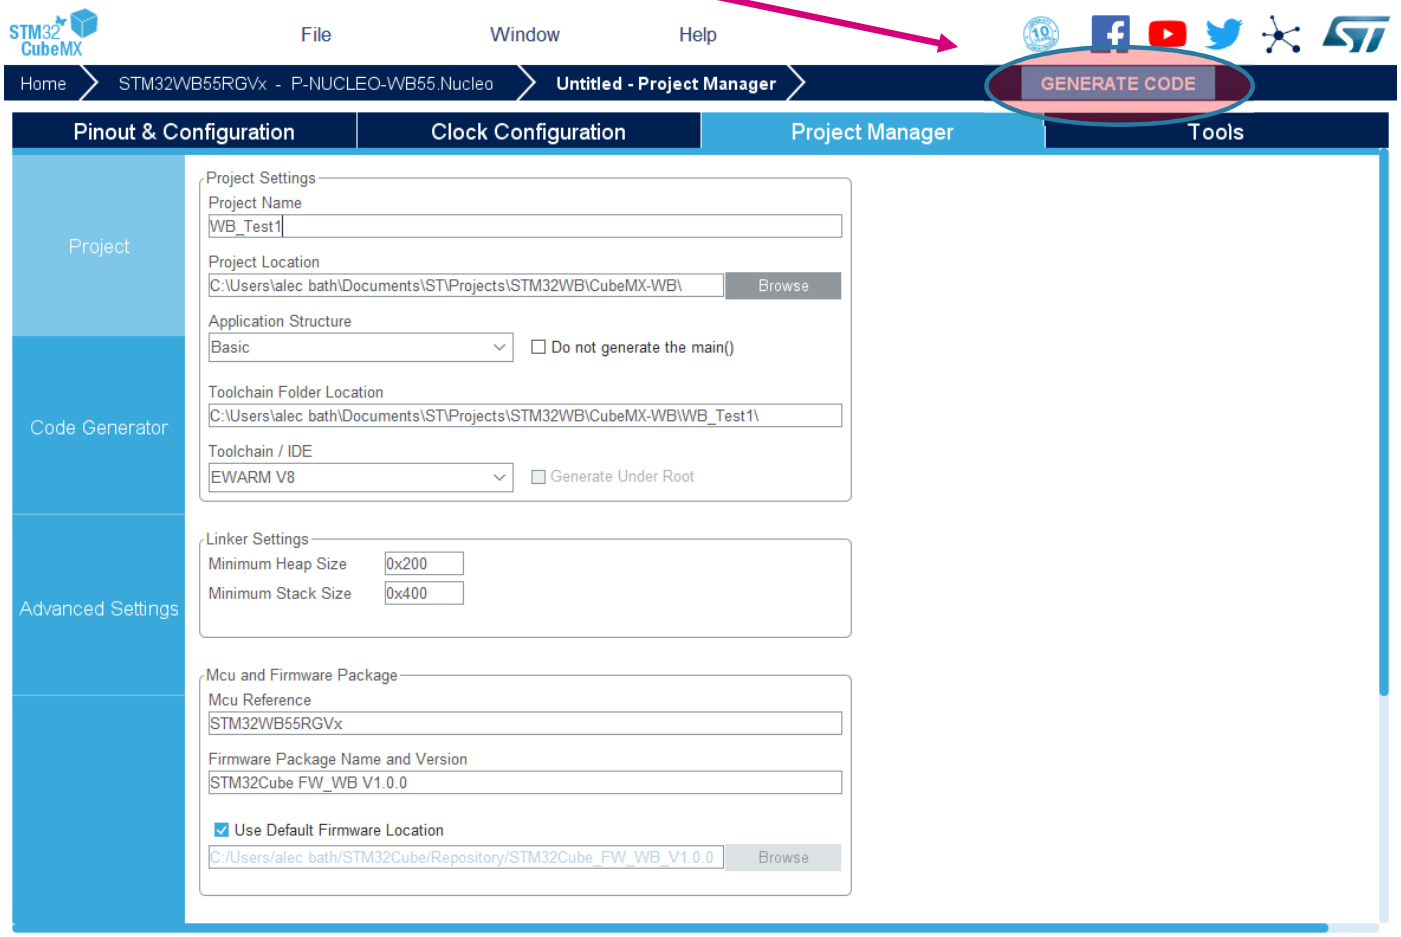


P-NUCLEO-WB55 Board Project

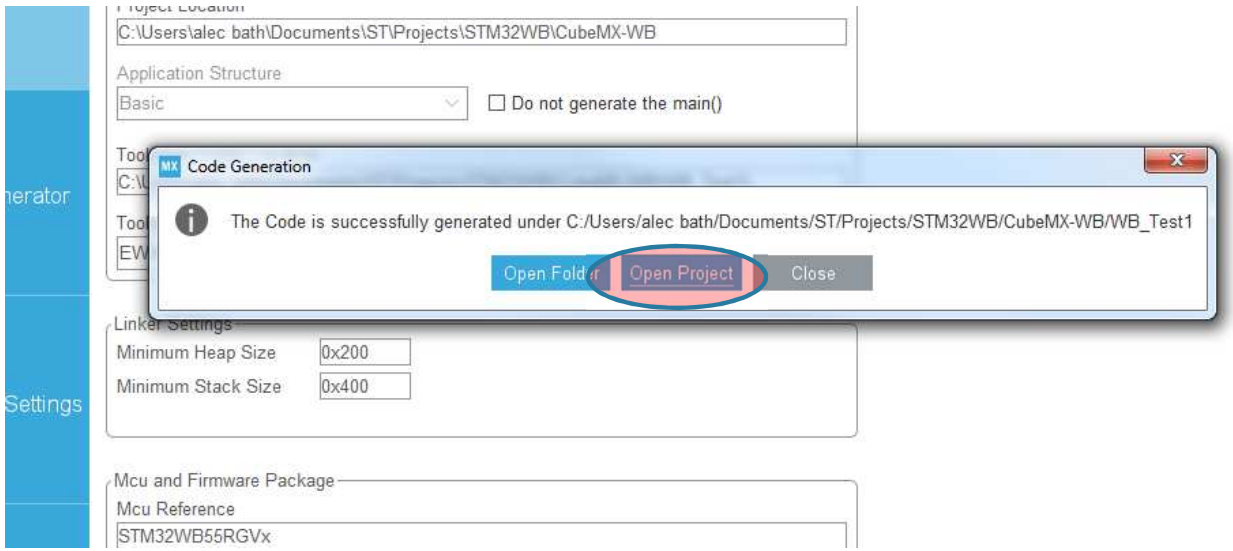
- Name your project
- Recommended Project location: C:\STM32WB_Workshop\
- Use EWARM V8 toolchain



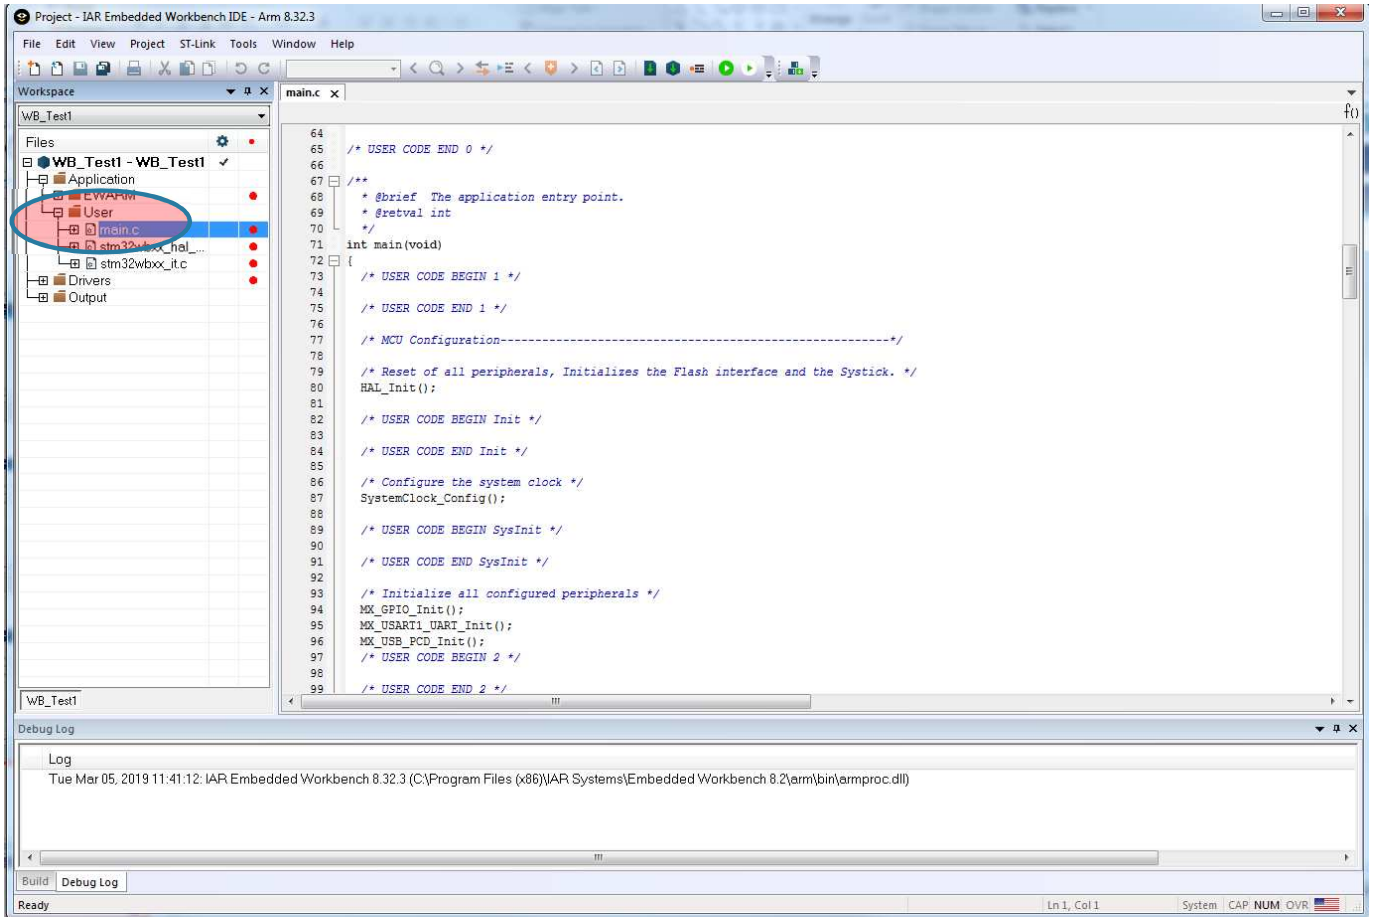
GENERATE CODE



Open Project



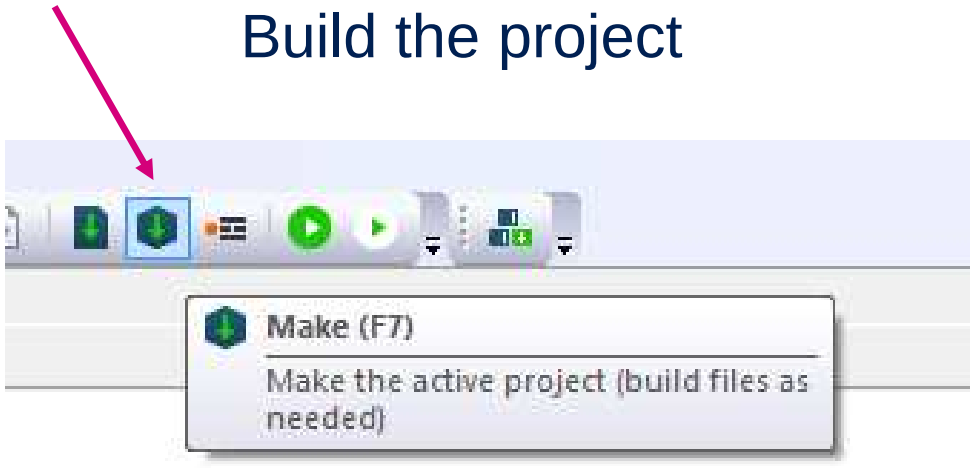
Expand the **User** file tree and Open **main.c**



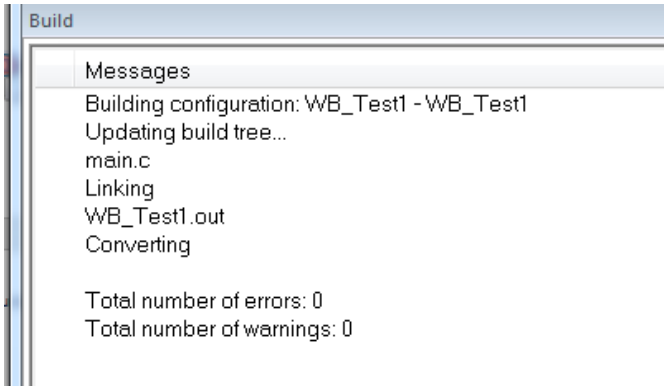
Add some code to while(1) loop:

```
101   /* Infinite loop */
102   /* USER CODE BEGIN WHILE */
103   while (1)
104   {
105
106     HAL_GPIO_TogglePin(GPIOB, GPIO_PIN_5);
107     HAL_Delay(100);
108     HAL_GPIO_TogglePin(GPIOB, GPIO_PIN_0);
109     HAL_Delay(100);
110     HAL_GPIO_TogglePin(GPIOB, GPIO_PIN_1);
111     HAL_Delay(100);
112
113     /* USER CODE END WHILE */
114
```

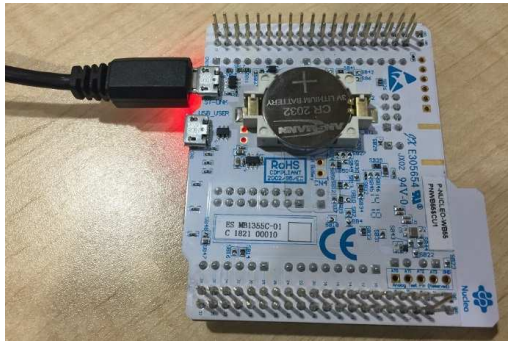
Build the project

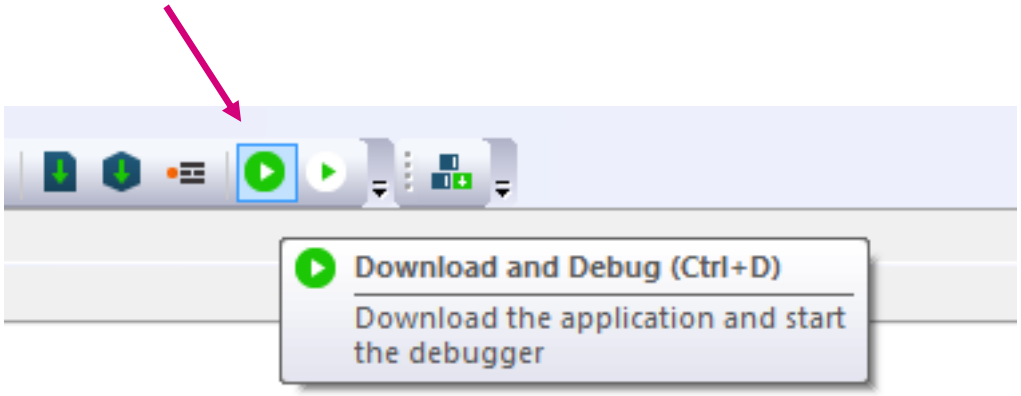


Check for errors

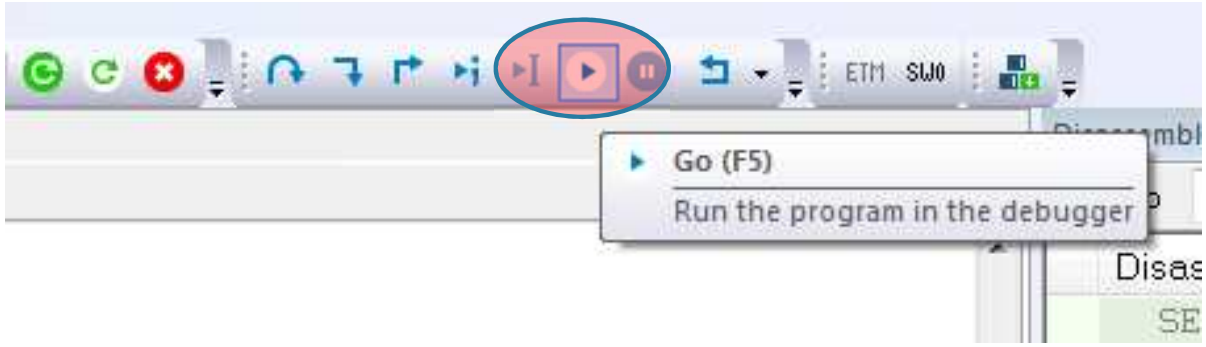


Download & Debug (attach your board) ☺

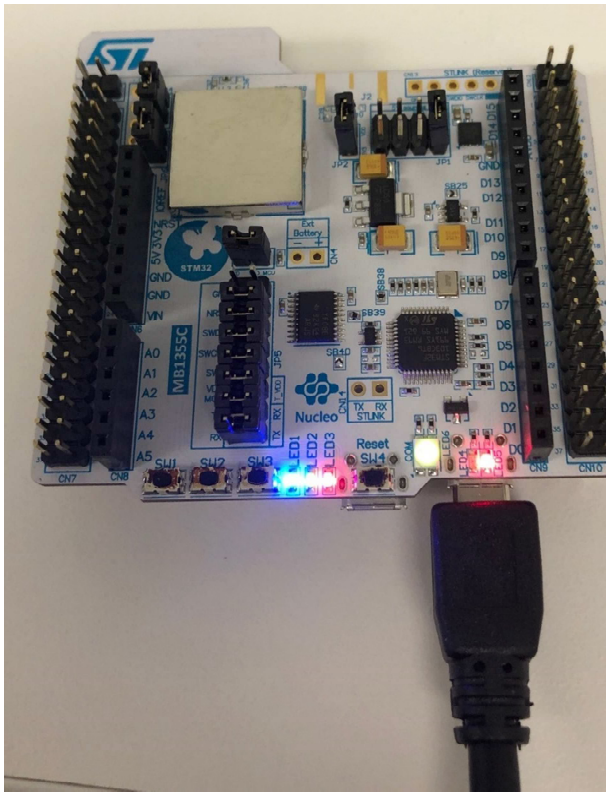




GO!



Enjoy the dancing LED's! ☺



Stop Debugging at the end of each lab and close IAR Embedded Workbench

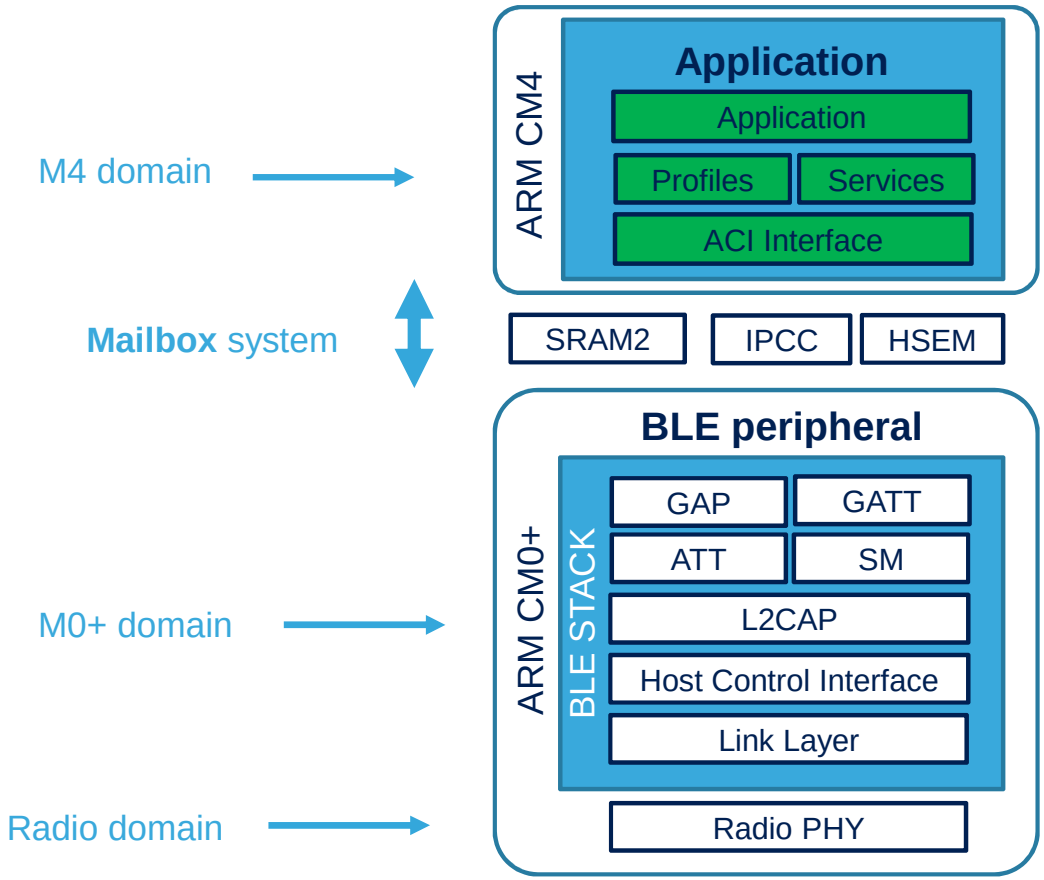
STM32 WB

BLE Protocol Stack layers



Bluetooth Classic (BR/EDR) vs Low Energy (LE)

100X lower

Longer range

Fast connection (only 3 advertising channels to scan)

Relaxed RF requirements (lower cost silicon / passives)

Comparison of Classic and Low Energy		
	Classic (BR/EDR)	**Low Energy (LE)**
Application	Cell phones, headsets, stereo/audio streaming, automotive (handsfree), PCs, etc.	Smartwatches, sport & fitness, home electronics, automation, industry, healthcare, smartphones, etc.
Voice	Yes	No
RF band ISM	2.4 GHz	2.4 GHz
Energy consumption	Reference	0.5…0.01 times Classic as reference
Coverage	10 m	≥ 10 m
Power	3 classes (max.): • +20 dBm • +4 dBm • 0 dBm	max. + 20 dBm four informative classes
Connection	Inquiry Yes, always hopping	Advertising Connection only if necessary, then hopping
Connection setup	100 ms	6 ms
RF channels	79 with 1 MHz spacing	40 with 2 MHz spacing • 3 advertising • 37 data (+ secondary advertis-ing)
Modulation	GFSK • BT = 0.5 • Deviation = 160 kHz • Mod index = 0.28….0.35 π/4-DQPSK 8DPSK	GFSK • BT = 0.5 • Deviation = 250 kHz or 500 kHz • Mod index = 0.45…0.55 • Stab Mod index = 0.495…0.505
Gross data rate	1…3 Mbit/s	1...2 Mbit/s
Application data rate	0.7…2.1 Mbit/s	0.2...0.6 Mbit/s

Strategically placed advertising channels

Remaining 37 channels are data channels

	BLE	Classic	
	BLE	BR	EDR
Modulation	GFSK 0.45 to 0.55	GFSK 0.28 to 0.35	DQPSK / 8DSPK
Data Rate	1Mbit/s	1 Mbit/s	2 and 3 Mbit/s
Channels	40	79	79
Spacing	2MHz	1MHz	-

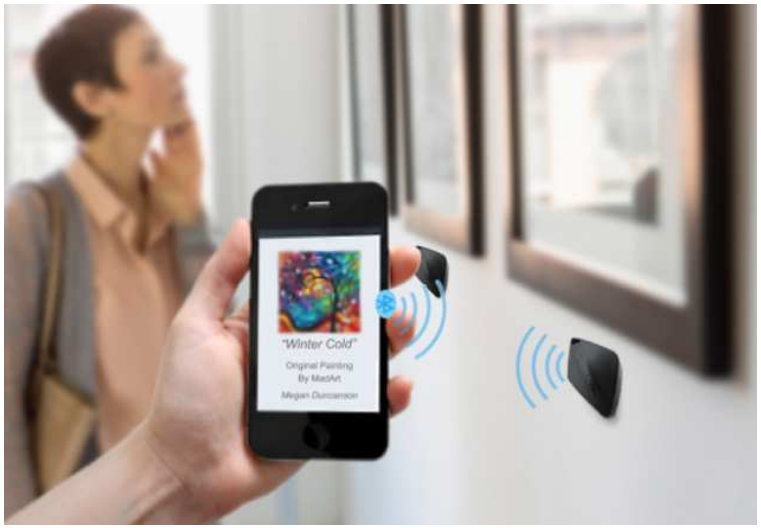
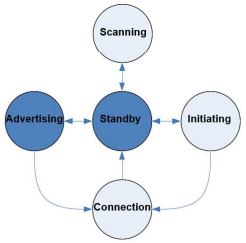
Roles and Modes

- Advertising Mode
- Connected Mode



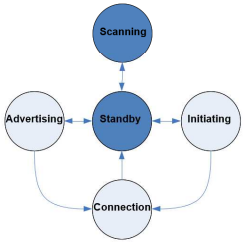
Broadcaster

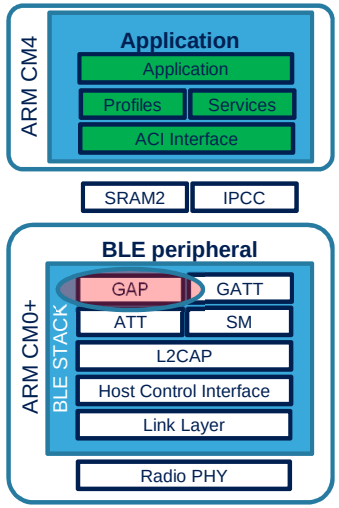
Sends advertising events
Can include characteristics and service data
Doesn't need receiver
Can be discoverable if it does have receiver



Observer

Receives advertising events
Listens for characteristics and service data
Doesn't need transmitter
Can discover devices if it does have transmitter



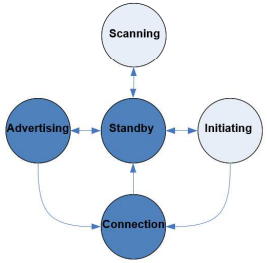


Roles and Modes

- Advertising Mode
- Connected Mode

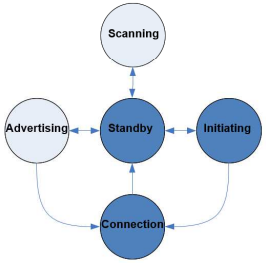
Peripheral

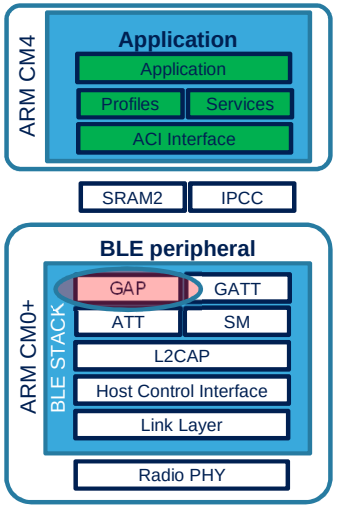
Has transmitter and receiver
Always slave
Connectable advertising



Central

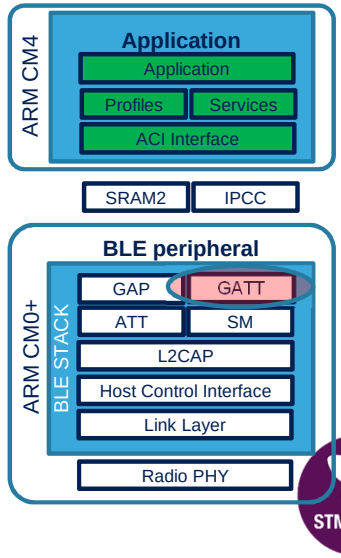
Has transmitter and receiver
Always master
Never advertises





GAP Central is also a “GATT Client”

GAP Peripheral” is also a “GATT Server”



life.augmented

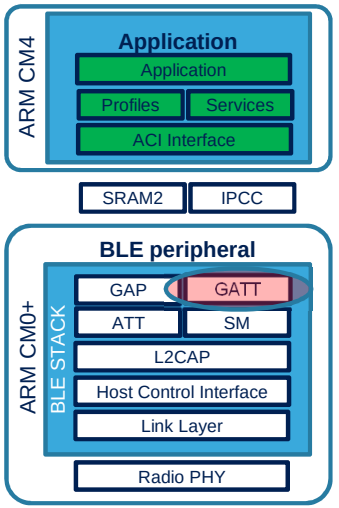
GATT Database details – Handles, UUID's & Values

Once the GATT Server's database information is known to the GATT Client, it can reference data via **Handles**

- ***"What is the temperature reported by the Thermometer Service?"*** ATT read command of Handle 0x0102
- ***"What are the units of temperature used?"*** ATT read command of Handle 0x0104

Handle	UUID	Description	Value
0x0100	0x2800	Thermometer service definition	UUID 0x1816
0x0101	0x2803	Characteristic: temperature	UUID 0x2A2B Value handle: 0x0102
0x0102	0x2A2B	Temperature value	20 degrees
0x0104	0x2A1F	Descriptor: unit	Celsius
0x0105	0x2902	Client characteristic configuration descriptor	0x0000
0x0110	0x2803	Characteristic: date/time	UUID 0x2A08 Value handle: 0x0111
0x0111	0x2A08	Date/Time	1/1/1980 12:00



Attribute protocol details (ATT)

- Access GATT database information on the *Server*
- Operations
  - Read
  - Write / Write without response
  - Indicate / Notify
- Four elements
  - 16-bit **Handle**
  - **Type** of attribute (UUID)
  - **Value**
  - Attribute **Permissions** (Read-only, etc)

Handle	UUID	Description	Value
0x0100	0x2800	Thermometer service definition	UUID 0x1816
0x0101	0x2803	Characteristic: temperature	UUID 0x2A2B Value handle: 0x0102
0x0102	0x2A2B	Temperature value	20 degrees
0x0104	0x2A1F	Descriptor: unit	Celsius
0x0105	**0x2902**	**Client characteristic configuration descriptor**	**0x0000**
0x0110	0x2803	Characteristic: date/time	UUID 0x2A08 Value handle: 0x0111
0x0111	0x2A08	Date/Time	1/1/1980 12:00

STM32 WB

Custom GATT – BLE Drill

- Battery Monitoring Service (BAS)
- Alert Notification Service (ANS)
- Elapsed motor use in minutes
- Unlock the drill via smartphone password
  - Add standard Services & Characteristics (16-bit UUID’s from Bluetooth SIG)
  - Create custom services (128-bit UUID’s)

UUID's: 16-bit or 128-bit

- **Universally Unique Identifiers (UUID's) are simply 128-bit (16-byte) numbers:**
  - **10c17863-9471-4427-8d66-82579bf9161a**
  - **Format is typically arranged as 4-2-2-2-6 and hexadecimal is assumed**
  - To send packets more efficiently, the Bluetooth SIG has adopted a standard 112-bit UUID base:
  - 0000XXXX-0000-1000-8000-00805F9B34FB
  - With a 16-bit SIG-identified service, characteristic, etc, you can use this short-form
    - For example, the Glucose Service in our CGM profile is:
  - 00001808-0000-1000-8000-00805F9B34FB
  - *Custom* services / characteristics / descriptors need a fully defined 128-bit UUID
    - *Our Custom Drill needs an Unlock service.*
    - We can generate a random UUID for it at https://www.uuidgenerator.net/
  - *There is also a 32-bit UUID specifier option*

UUID's: 16-bit or 128-bit

- Universally Unique Identifiers (UUID's) are simply 128-bit (16-byte) numbers:
  - 10c17863-9471-4427-8d66-82579bf9161a
  - Format is typically arranged as 4-2-2-2-6 and hexadecimal is assumed
  - **To send packets more efficiently, the Bluetooth SIG has adopted a standard 112-bit UUID base:**
  - **0000XXXX-0000-1000-8000-00805F9B34FB**
  - With a 16-bit SIG-identified service, characteristic, etc, you can use this short-form
    - For example, the Glucose Service in our CGM profile is:
  - 00001808-0000-1000-8000-00805F9B34FB
  - *Custom* services / characteristics / descriptors need a fully defined 128-bit UUID
    - *Our Custom Drill needs an Unlock service.*
    - We can generate a random UUID for it at https://www.uuidgenerator.net/
  - *There is also a 32-bit UUID specifier option*

UUID's: 16-bit or 128-bit

- Universally Unique Identifiers (UUID's) are simply 128-bit (16-byte) numbers:
  - 10c17863-9471-4427-8d66-82579bf9161a

- **Pairing**: Connected devices exchange encryption keys to **encrypt** the link. There are now **paired**.
- **Bonding**: Paired devices can be bonded – Keys are stored for the next connection.
- **Whitelisting**: Restrict connections from any other than known devices.

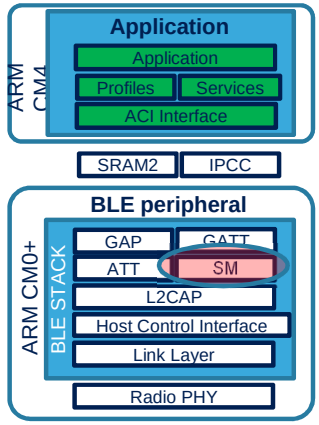
- Security modes are deployed after a BLE connection is established
- BLE Link Layer uses AES-128 CCM mode for authenticated encryption

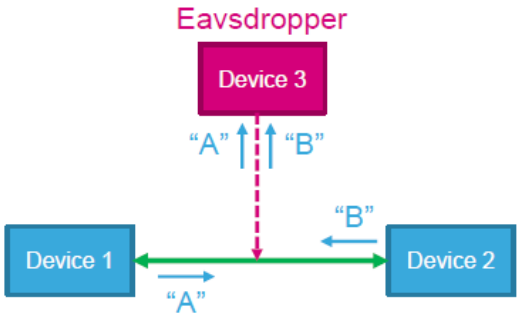
Typical attacks

- **Passive eavesdropping:**
  - A third device listens in to the data being exchanged between the two paired devices
  - Overcome by AES-CCM encryption

- **MITM**
  - A malicious device impersonates the other two legitimate devices

- **Identity tracking**
  - Malicious entity associates BLE device address to physically track the user
  - BLE overcomes this is by periodically changing the device address.



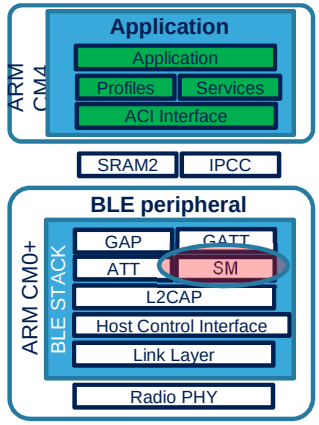


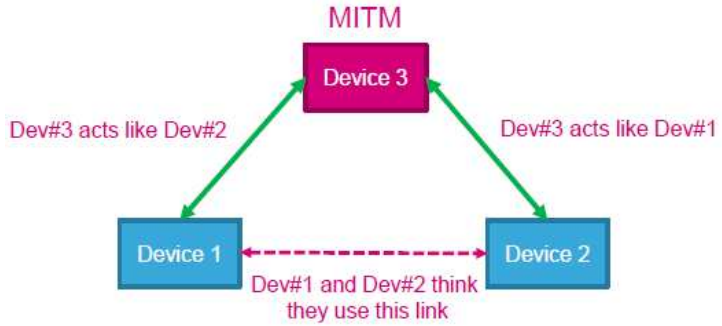
Typical attacks

- **Passive eavesdropping:**
  - A third device listens in to the data being exchanged between the two paired devices
  - Overcome by AES-CCM encryption

- **MITM**
  - A malicious device impersonates the other two legitimate devices

- **Identity tracking**
  - Malicious entity associates BLE device address to physically track the user
  - BLE overcomes this is by periodically changing the device address.



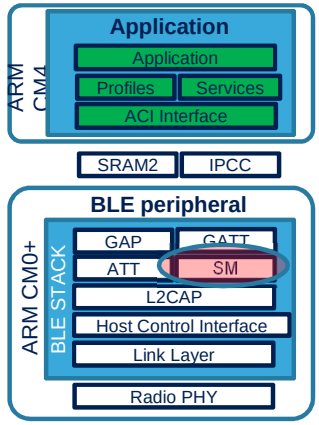


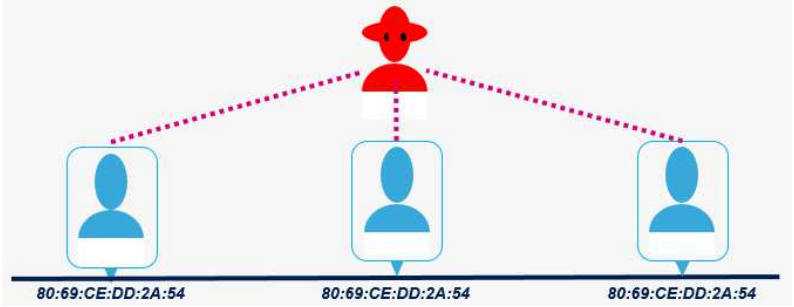
Typical attacks

- **Passive eavesdropping:**
  - A third device listens in to the data being exchanged between the two paired devices
  - Overcome by AES-CCM encryption

- **MITM**
  - A malicious device impersonates the other two legitimate devices

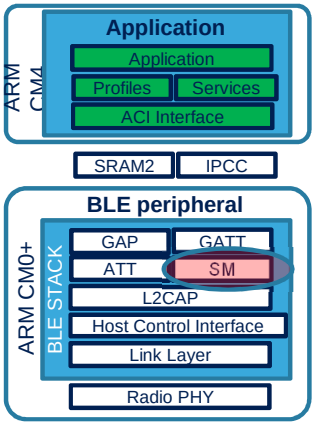
- **Identity tracking**
  - Malicious entity associates BLE device address to physically track the user
  - BLE overcomes this is by periodically changing the device address.





Pairing Methods

- **Just Works™:**
  - Still vulnerable to MITM attack
- **Out of Band (OOB) Pairing:**
  - Keys exchanged over a different wireless technology such as NFC
- **Passkey:**
  - 6-digit number entered on each device
  - Assumes keypad capability
- **Numeric Comparison:**
  - Similar to Just Works™, but adds a 6-digit confirmation value
  - Additional protection from MITM attacks



Pairing Methods

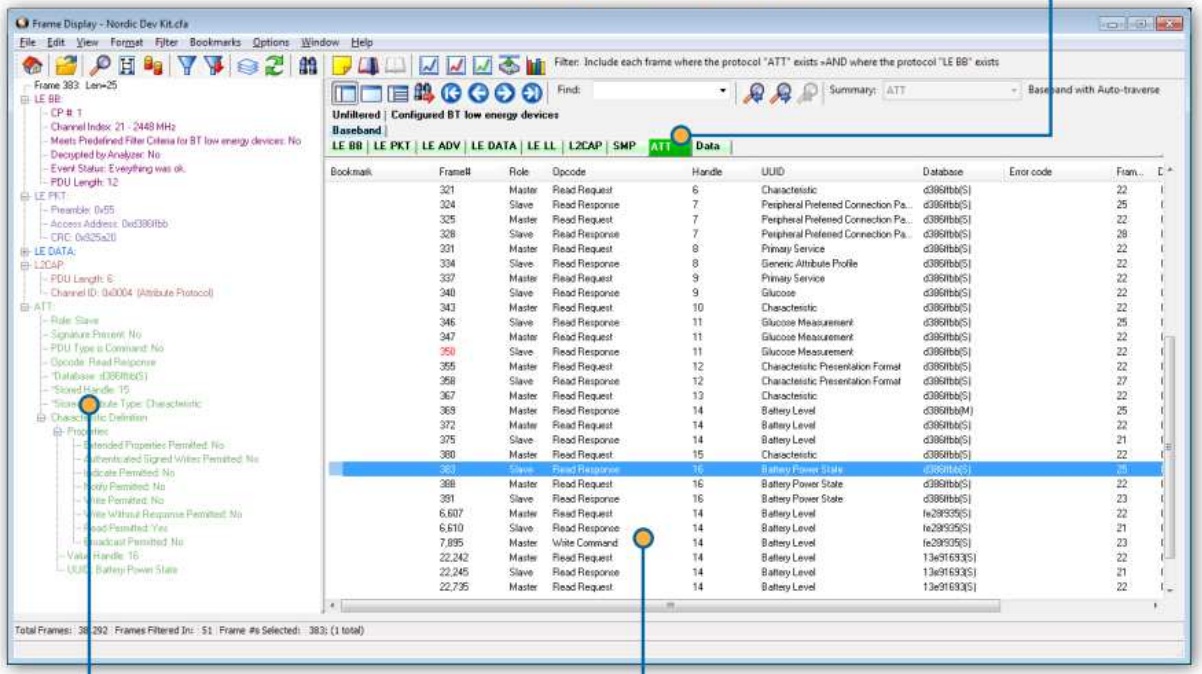
Link Layer Filtering

A “White List” can **optionally** be used to filter device addresses

- **Advertising State** - An advertiser *shall process connection requests only from devices in the White List*
- **Scanning State** – *A scanner shall process advertising packets only from White-Listed devices*
- **Initiating State** - *An initiator shall process connectable advertising packets only from White-Listed devices*

BLE Sniffer

Filter Tabs isolate frames by profile or protocol for quick and convenient viewing of specific kinds of data.



Decode Pane shows comprehensive layered decoders of each frame/message with clear, concise descriptions.

Summary Pane displays a one line overview of each data frame/message. Click on any line to reveal detail in mutiple panes below.

Core Specifications

The *Bluetooth*® Core Specification defines the technology building blocks that developers use to create the interoperable devices that make up the thriving Bluetooth ecosystem. The Bluetooth specification is overseen by the Bluetooth Special Interest Group (SIG) and is regularly updated and enhanced by Bluetooth SIG Working Groups to meet evolving technology and market needs.

Specification		Version	Status	Adoption Date
CS	Core Specification	5.0	Active	06 Dec 2016
CSS	Core Specification Supplement	7	Active	06 Dec 2016
CSA	Core Specification Addendum	6	Active	12 Jul 2017

- Assigned Numbers

GATT Specifications

Generic Attributes (GATT) services are collections of characteristics and relationships to other services that encapsulate the behavior of part of a device.

A *GATT profile* describes a use case, roles, and general behaviors based on the GATT functionality, enabling extensive innovation while maintaining full interoperability with other *Bluetooth*® devices.

The documents in the "Informative document showing changes" column are provided as a courtesy to help readers identify changes between two versions of a Bluetooth specification. When implementing specifications, use the adopted versions in the "Adopted Version" column.

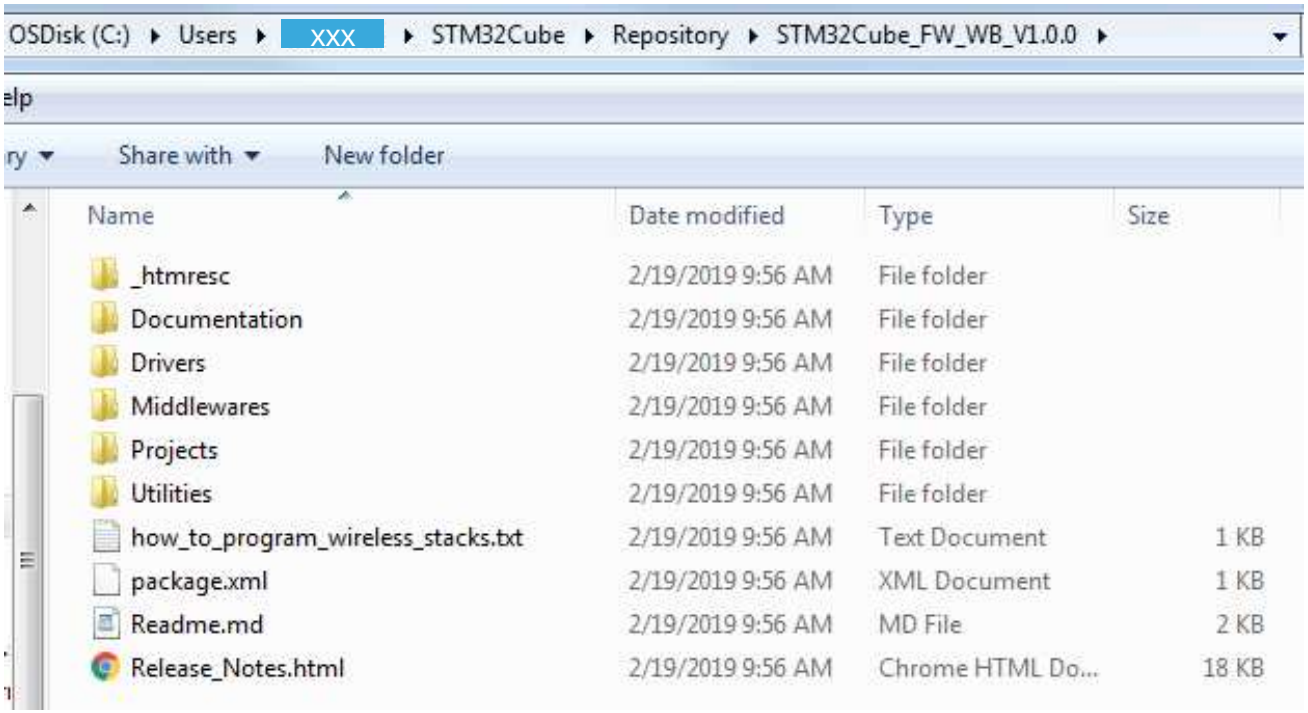
Hands-On

Heart-Rate Monitor

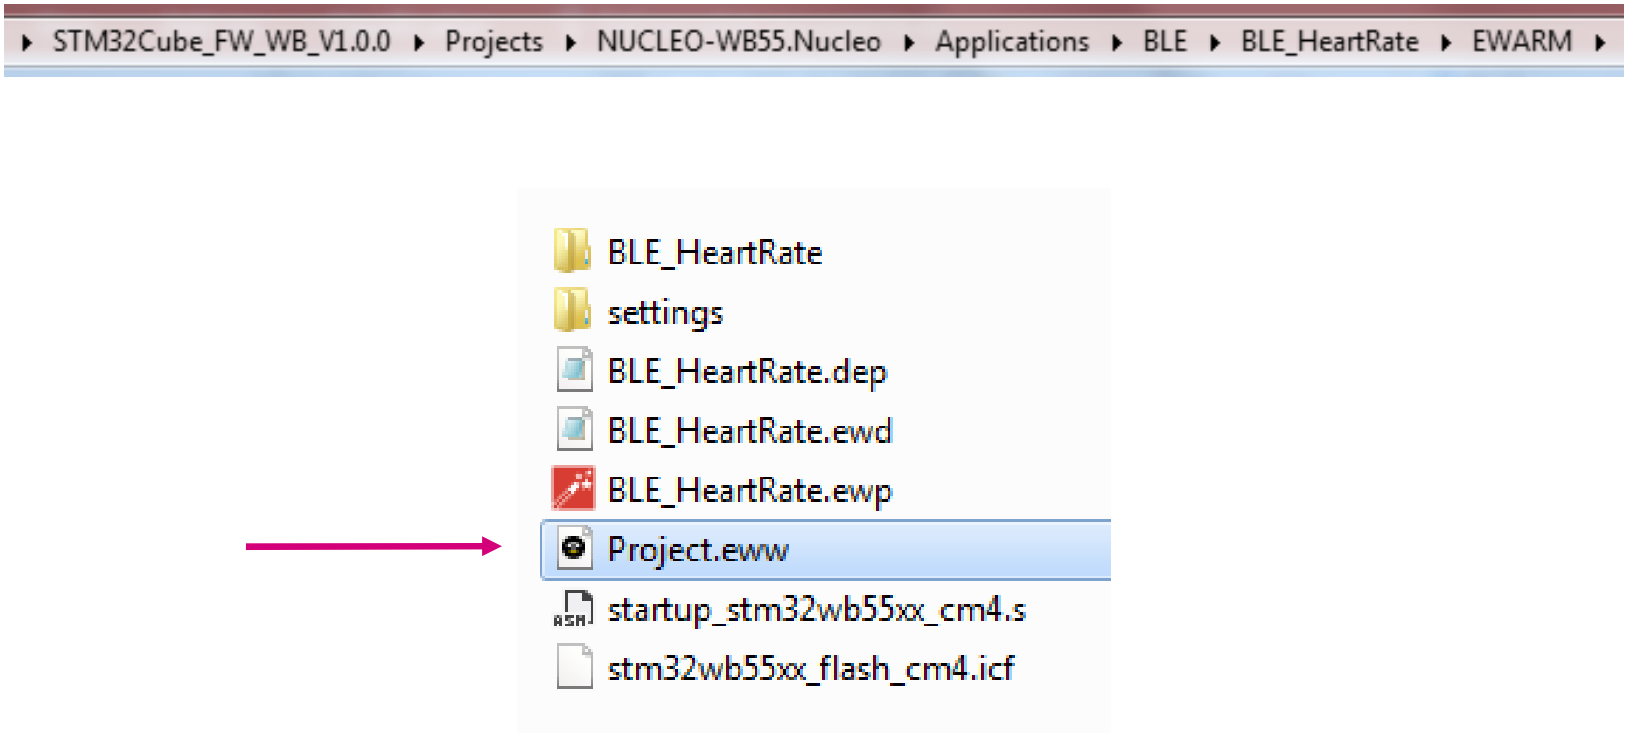
life.augmented

STM32 WB

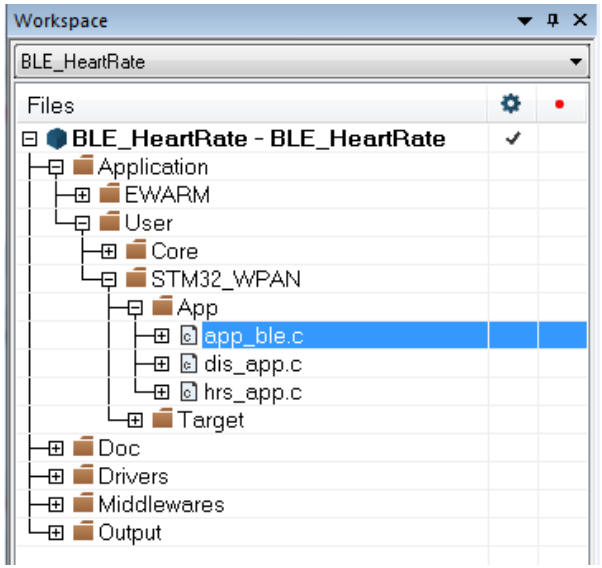
All CubeWB Projects referenced today can be found in the CubeMX Repository folder:



Open the BLE_HeartRate workspace



Open **app_ble.c**



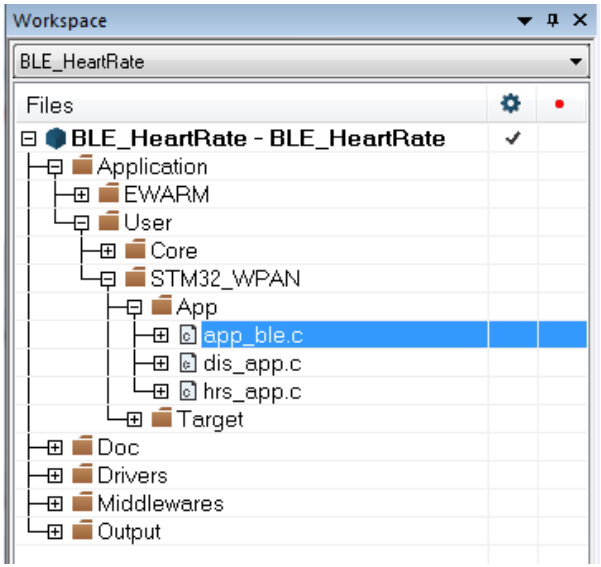
Change the **local name**, using your *Magic Number*!

*(You can change it as you wish, however keep the # of ASCII chars to **5**)*

```
229   static const char local_name[] = { AD_TYPE_COMPLETE_LOCAL_NAME ,'H','R','S','T','M'};
230   uint8_t  manuf_data[14] = {
```

```
229   static const char local_name[] = { AD_TYPE_COMPLETE_LOCAL_NAME ,'S','T','M','1','2'};
```

Hands-On: HRM example



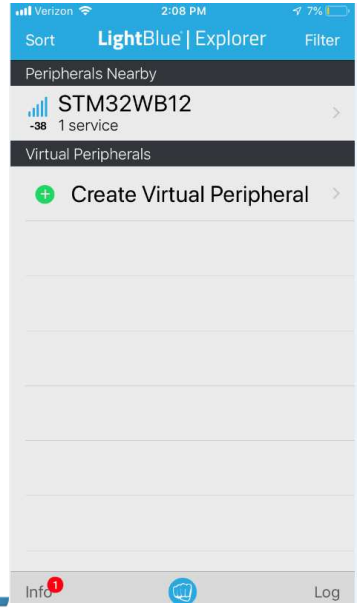
Also change the advertised **name** and the **NAME_LENGTH**, using your *Magic Number*!

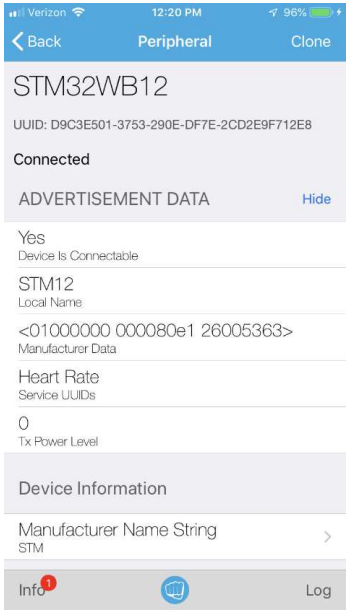
```
177   /* Private defines -----------------------
178   #define APPBLE_GAP_DEVICE_NAME_LENGTH 9
```

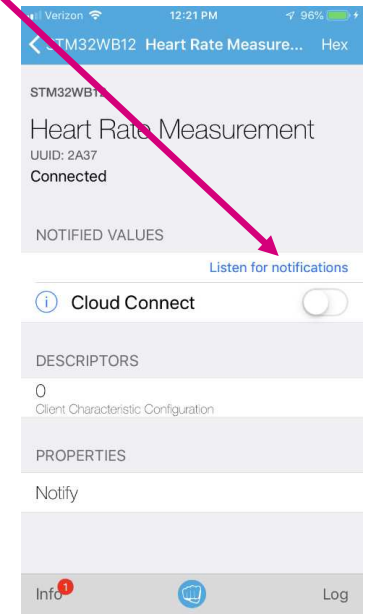
```
630     if (role > 0)
631     {
632       const char *name = "STM32WB12";
633       aci_gap_init(role, 0,
```

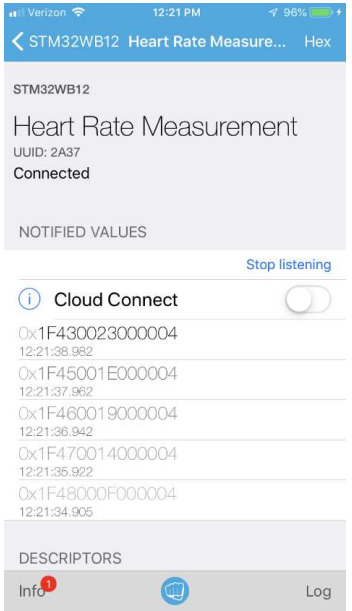
Hands-On: HRM example

- Open your LightBlue Explorer App on **iOS**
- Find your device and tap on it
- **Show** Advertisement Data
- Click on the Heart Rate Measurement and Enable Notifications



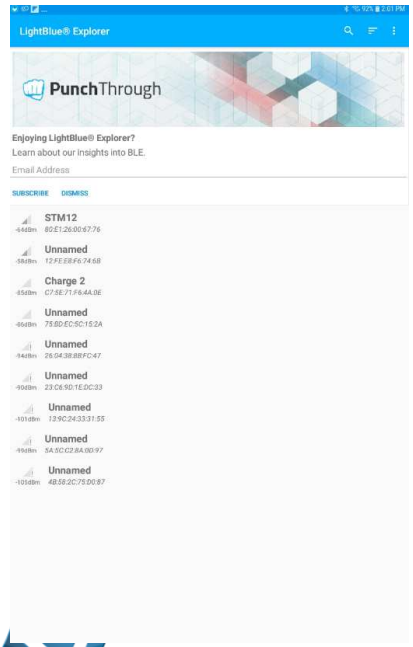


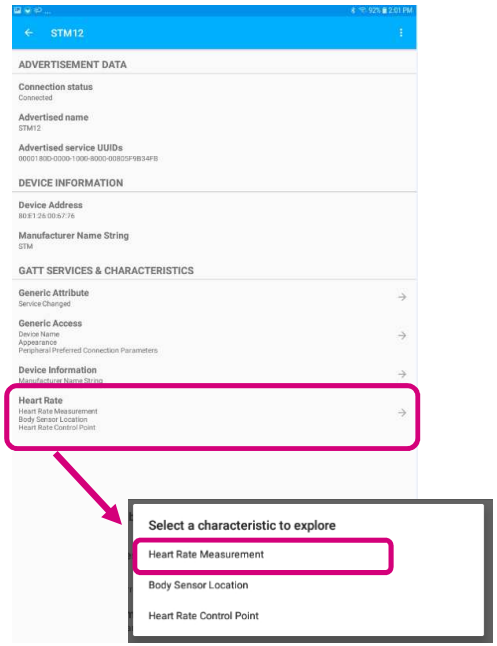


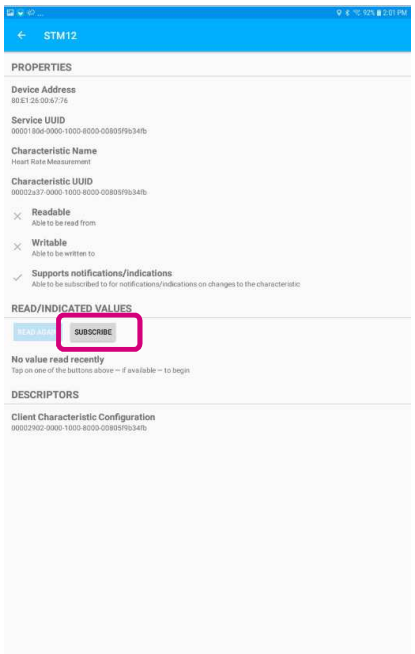


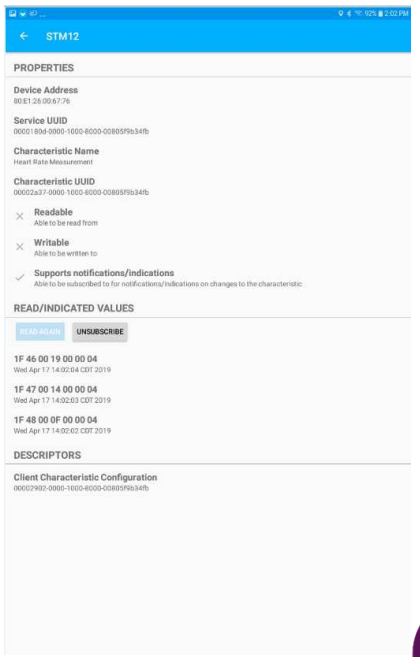
Hands-On: HRM example

- Open your LightBlue Explorer App on **Android**
- Find your device and tap on it
- Tap on the Heart Rate section and select Heart Rate Measurement
- Tap on “SUBSCRIBE” to Enable Notifications









life.augmented

STM32 WB

Hands-On: HRM example

- Disconnect from the LightBlue Explorer App
- Launch the ST BLE Sensor App
- Tap on your device name
- Write down your Nucleo Bluetooth Device Address.
  - *Can you find it in the Mfr-Specific advertised data via LightBlue app?*

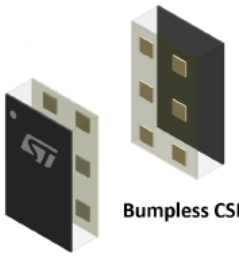
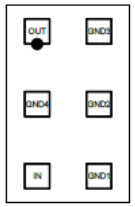
MLPF-WB55-01E3

Datasheet

2.4 GHz low pass filter matched to STM32WB55Cx/Rx



Top view (pads down)



Features

- Integrated impedance matching to STM32WB55Cx and STM32WB55Rx
- LGA footprint compatible
- 50 Ω nominal impedance on antenna side
- Deep rejection harmonics filter
- Low insertion loss
- Small footprint
- Low thickness ≤ 450 µm
- High RF performance
- RF BOM and area reduction
- ECOPACK®2 compliant

Applications

- Bluetooth 5
- OpenThread
- Zigbee®
- IEEE 802.15.4
- Optimized for STM32WB55Cx and STM32WB55Rx

Purpose

This release covers the delivery of STM32WB Coprocessor binaries.

Here is the list of the supported binaries:

- stm32wb5x_BLE_Stack_fw.bin
  - Full BLE Stack 5.0 certified : Link Layer, HCI, L2CAP, ATT, SM, GAP and GATT database
  - BT SIG Certification listing : Declaration ID D042164
- stm32wb5x_BLE_HCILayer_fw.bin
  - HCI Layer only mode 5.0 certified : Link Layer, HCI
  - BT SIG Certification listing : Declaration ID D042213
- stm32wb5x_Thread_FTD_fw.bin
  - Full Thread Device certified v1.1
  - To be used for Leader / Router / End Device Thread role (full features excepting Border Router)

For complete documentation on STM32WBxx, visit: [www.st.com/stm32wb]

Update History

V1.0.0 / 06-February-2019

Main Changes

First release

First official release.

Binary Install Address and version : Provides Install address for the targeted binary to be used in "STEP 4" of flash procedure.

Wireless Processor Binary	Install address	Version	Date
stm32wb5x_BLE_Stack_fw.bin	0x080CB000	v1.0.0	02/06/2019

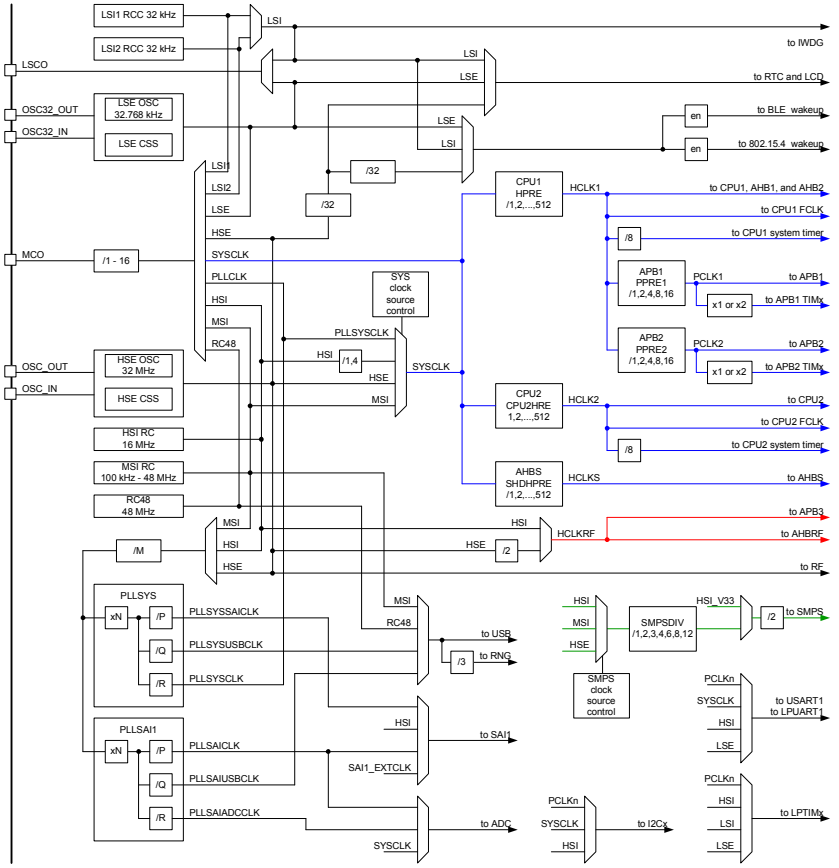
Clock tree

HSE (32MHz) required for radio operation

LSE (32.768KHz) required for most BLE applications



HSE Trimming

- BLE requires very accurate 32 MHz clock
- Frequency can vary
  - Manufacturing process variations
  - Crystal used
  - PCB design
- Integrated load capacitor bank
  - 64 values for fine tuning
  - MCO clock output pin used for measurement at factory test
  - Stored in OTP
- **No need for external capacitance**
- AN5042 provides details

Application Note AN5270 describes the ACI/HCI commands available

- via CubeMonitorRF
- via Application API's

2.3.2 ACI_HAL_WRITE_CONFIG_DATA

Description

This command writes a value to a low level configure data structure. It is useful to setup directly some low level parameters for the system in the runtime.

Input parameters

Table 108. **Input parameters**

Parameter	Size	Description	Possible values
Offset	1	Offset of the element in the configuration data structure which has to be written. The valid offsets are: • 0x00: Bluetooth public address, value length to be written: 6 bytes • 0x06: DIV used to derive CSRK, value length to be written: 2 bytes • 0x08: Encryption root key used to derive LTK and CSRK, value length to be written: 16 bytes • 0x18: Identity root key used to derive LTK and CSRK, value length to be written: 16 bytes • 0x2C: Link layer without host (for certification purposes), Value length to be written: 1 byte • 0x2E: Static random address: 6 bytes • 0x2F: Disable watchdog (1=disable, 0=enable), value length to be written: 1 byte	• 0x00: CONFIG_DATA_PUBADDR_OFFSET • 0x06: CONFIG_DATA_DIV_OFFSET • 0x08: CONFIG_DATA_ER_OFFSET • 0x18: CONFIG_DATA_IR_OFFSET • 0x2C: LL_WITHOUT_HOST • 0x2E: CONFIG_DATA_RANDOM_ADDRESS_WR • 0x2F: CONFIG_DATA_WATCHDOG_DISABLE
Length	1	Length of data to be written	-
Value	Length	Data to be written	-

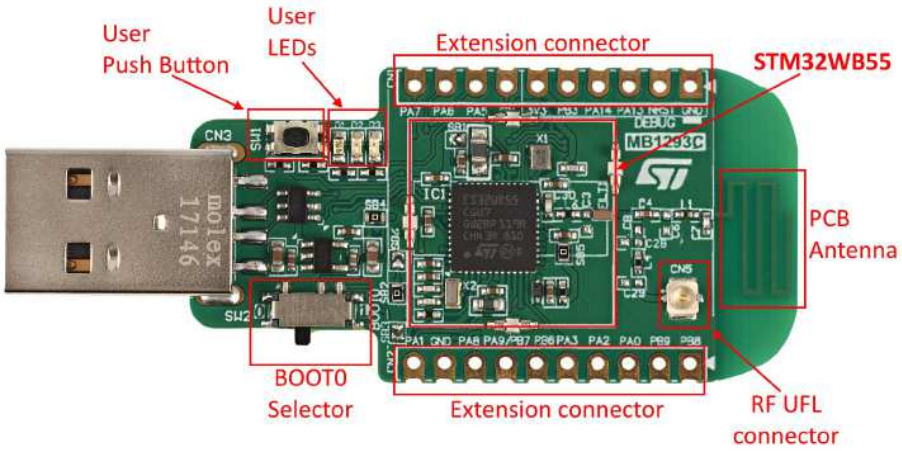
STM32 WB

WB55 Dongle Board

The USB Dongle is quite useful as the CubeMonitorRF sniffer

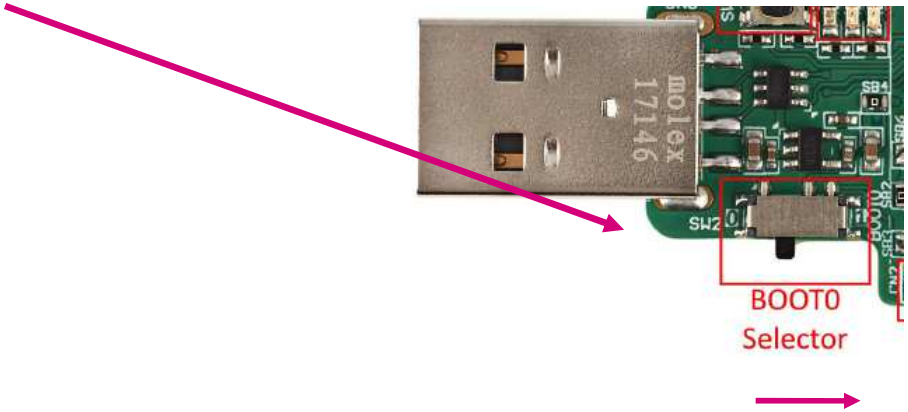
This project uses the USB CDC class directly (not the STLINK VCOM port) to parse commands

Although there is no STLINK on board, the USB bootloader can be invoked via **BOOT0 switch** & CubeProgrammer, and the binary can be programmed



Dongle config

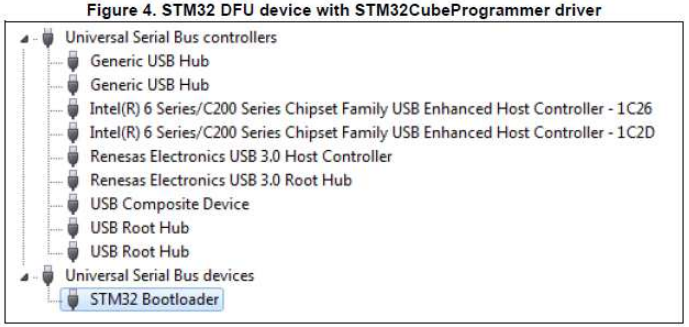
- Move Dongle Switch to Bootloader mode
- Plug in Dongle



Bootloader active to the right

- Ensure the driver has enumerated **“STM32 Bootloader”**

Figure 4. STM32 DFU device with STM32CubeProgrammer driver



life.augmented

STM32 WB

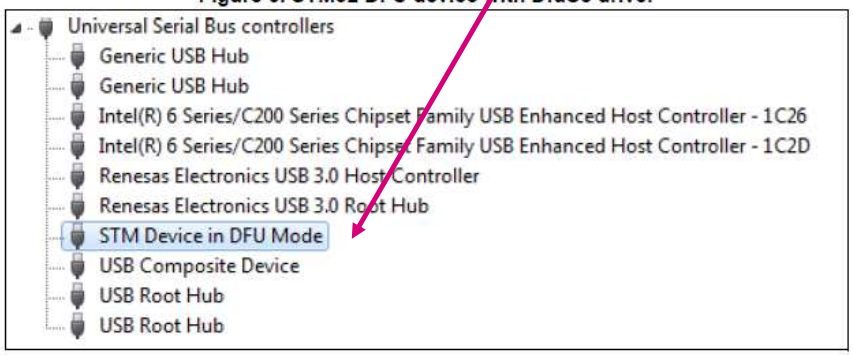
Chapter 1.2.4 details the DFU driver install / update procedure

Old or Native MS drivers must be replaced to properly access the bootloader

Figure 2. Deleting the old driver software

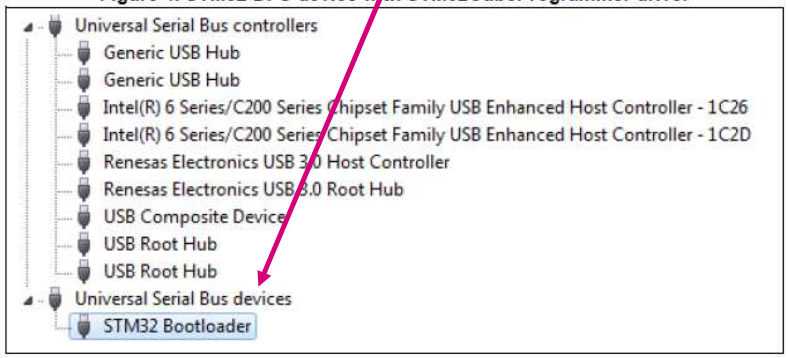
Old Driver

Figure 3. STM32 DFU device with DfuSe driver

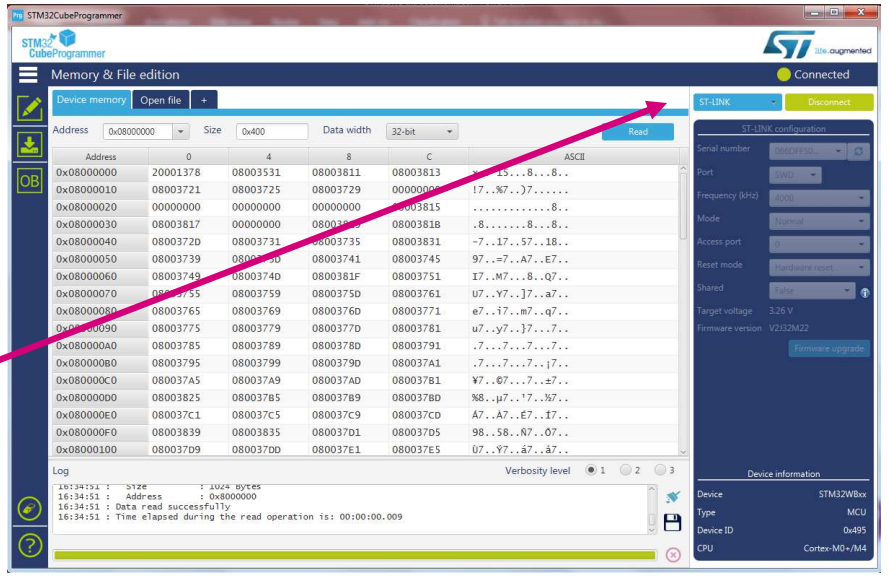


New Driver!

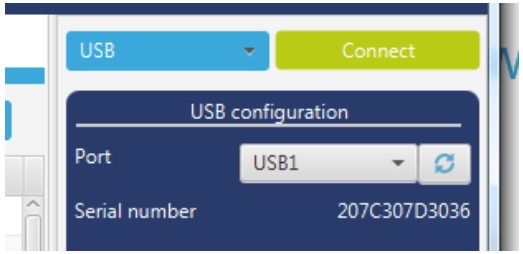
Figure 4. STM32 DFU device with STM32CubeProgrammer driver



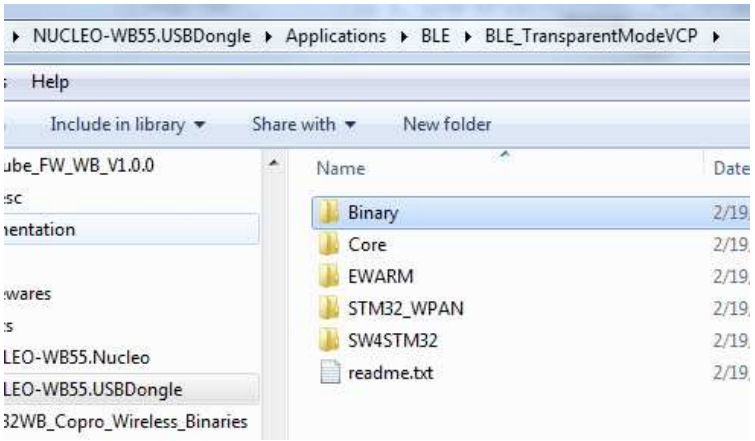
- Open STM32 CubeProgrammer

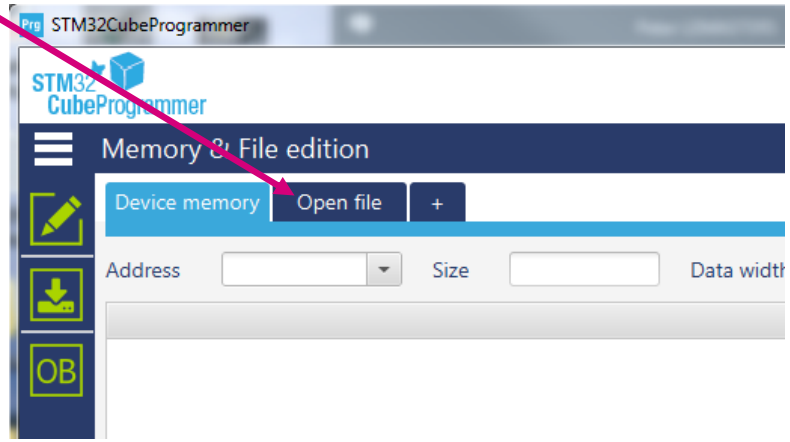


- Select **USB** mode and **Connect**

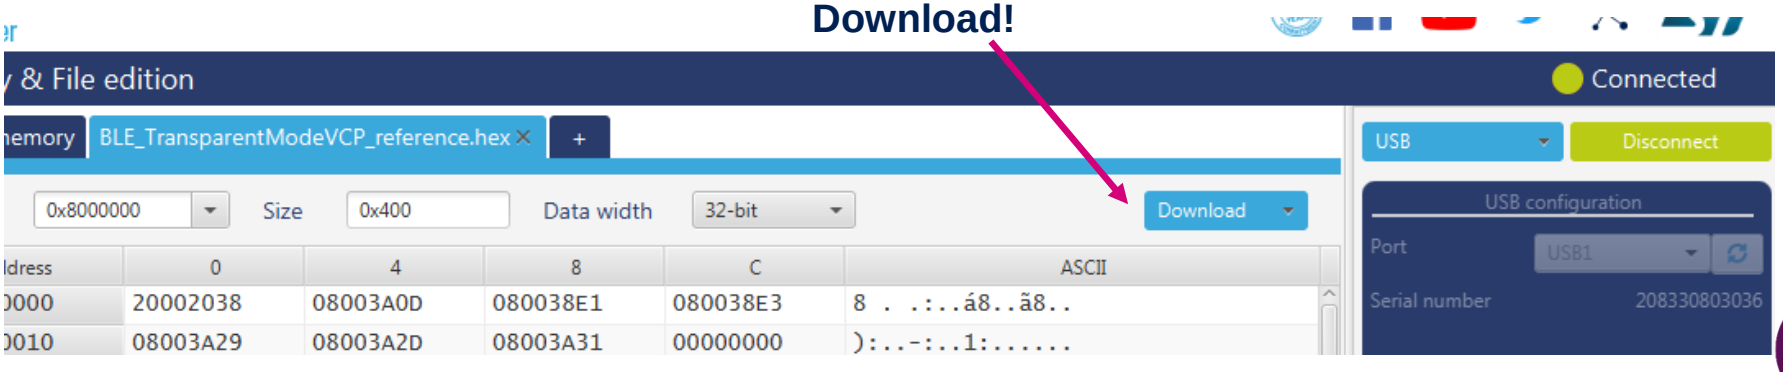


Open the BLE_TransparentModeVCP_reference.hex file for Dongle



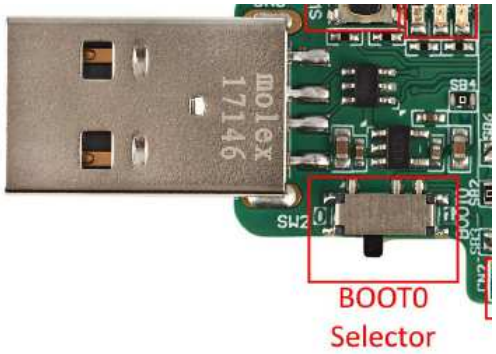


Download!



Dongle config

- Disconnect from CubeProgrammer
- Unplug Dongle
- Move Dongle Switch back to normal boot mode
- Plug Dongle back in for normal boot startup
- Now you should be able to use **COMxx** in CubeMonitorRF
  - *(may differ from COM74)*
- **CONNECT**



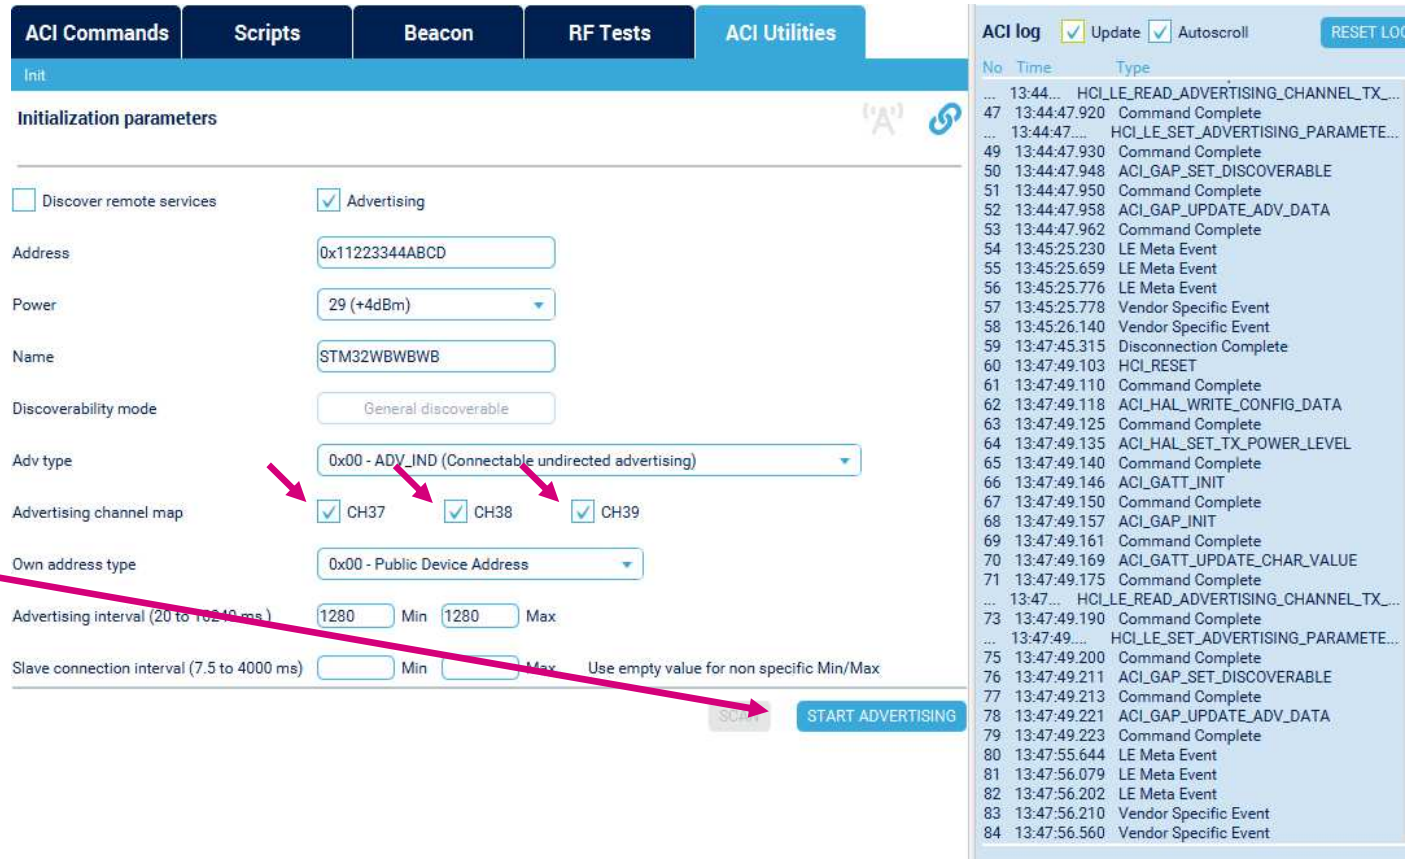
Normal Boot to the left

life.augmented

STM32 WB

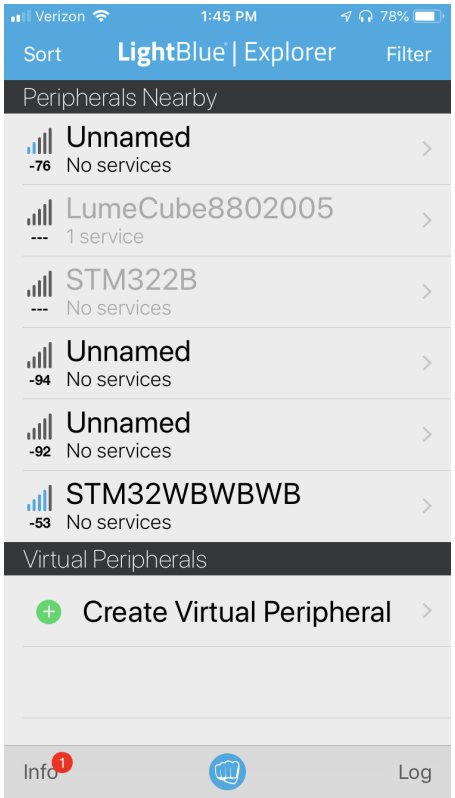
- Change the Bluetooth Address and Name. (Use your Magic Number!)
- Use Connectable advertising on all channels (37/38/39)

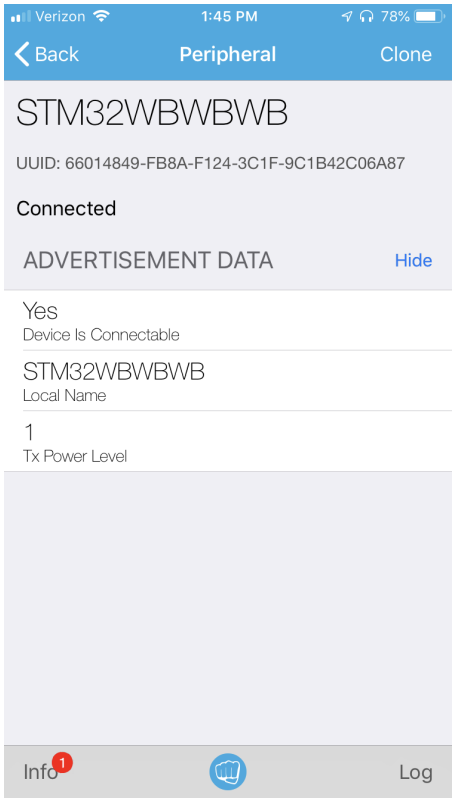
Start



LightBlue Explorer

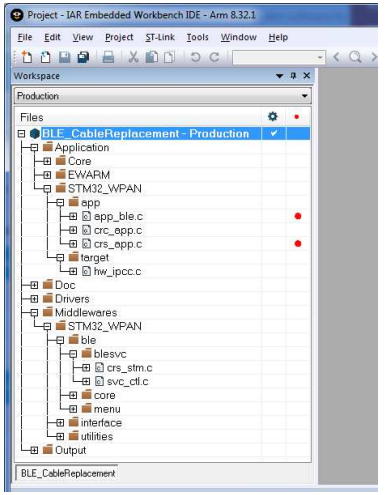
- Use LightBlue Explorer to connect to and interrogate your GAP peripheral





Hands-On

Custom GATT & Cable Replacement



life.augmented

STM32 WB

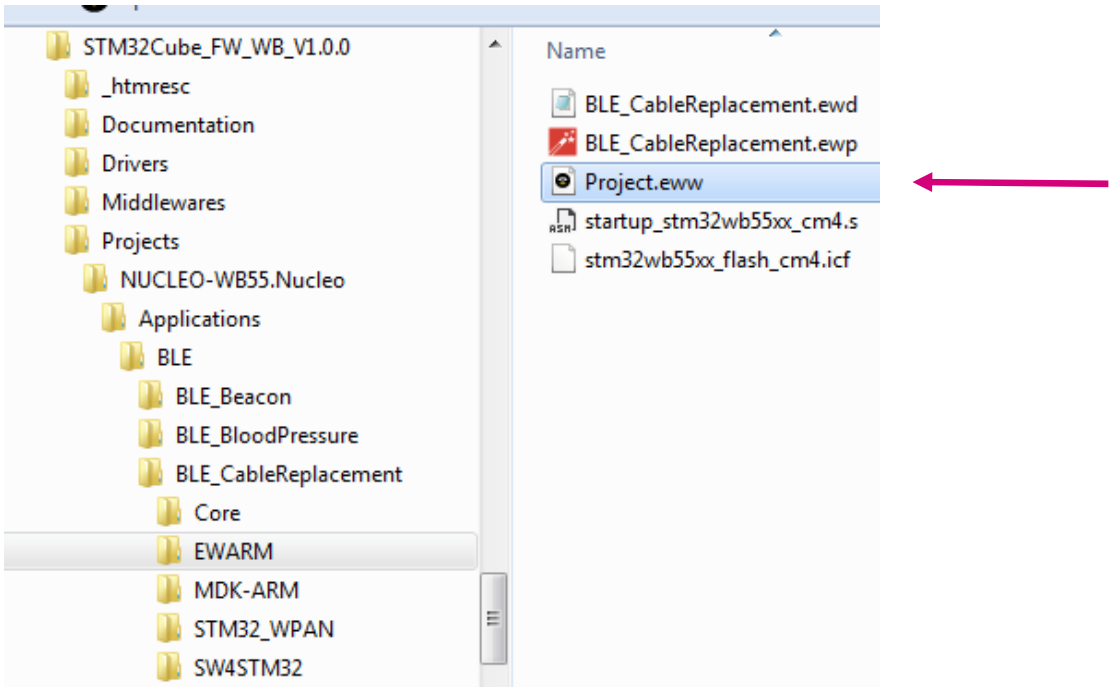
Open, Compile, Program & Run the Nucleo Board ***CableReplacement*** example

Add a custom GATT Characteristic for LED control

You can copy/paste the code bits from **CableReplacement_Lab.txt** *file from your install files* **Labs** *folder*

BLE_CableReplacement Project

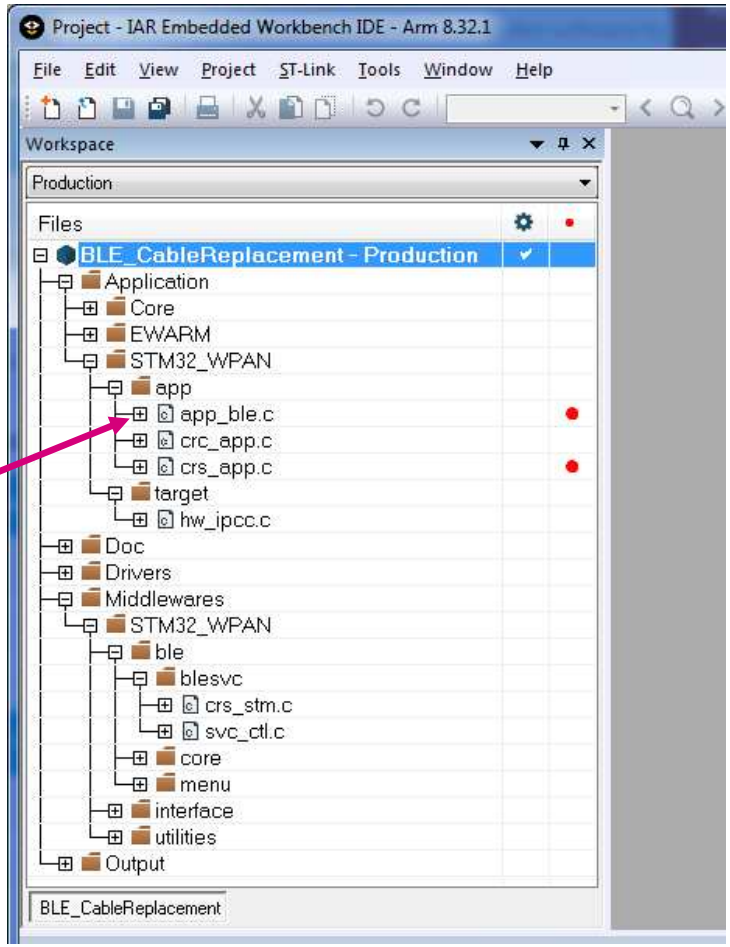
- Open the workspace



BLE_CableReplacement Project

- Build the Project

- Open the following files
  - app_conf.h
  - app_ble.c – Under Application/STM32_WPAN/app
  - ble_conf.h
  - crs_stm.h
  - crs_stm.c
  - crs_app.c



To see the header files, expand the C source files

BLE Role Configuration

- STM32WB is the GAP Peripheral / GATT server
- Smartphone is the GAP Central / GATT client.

Compile for GATT Server

- Modify the #define (line# 100 of **app_conf.h)**

```
#define GATT_CLIENT                0    /* 1 = Device is GATT Client, 0 = Device is GATT Server */
```

Identify your unique device with your magic number

- Modify your local name (line# 204 of app_ble.c)

```
static const char local_name[] = { AD_TYPE_COMPLETE_LOCAL_NAME, 'C', 'R', 'S', '0', '1' };
```

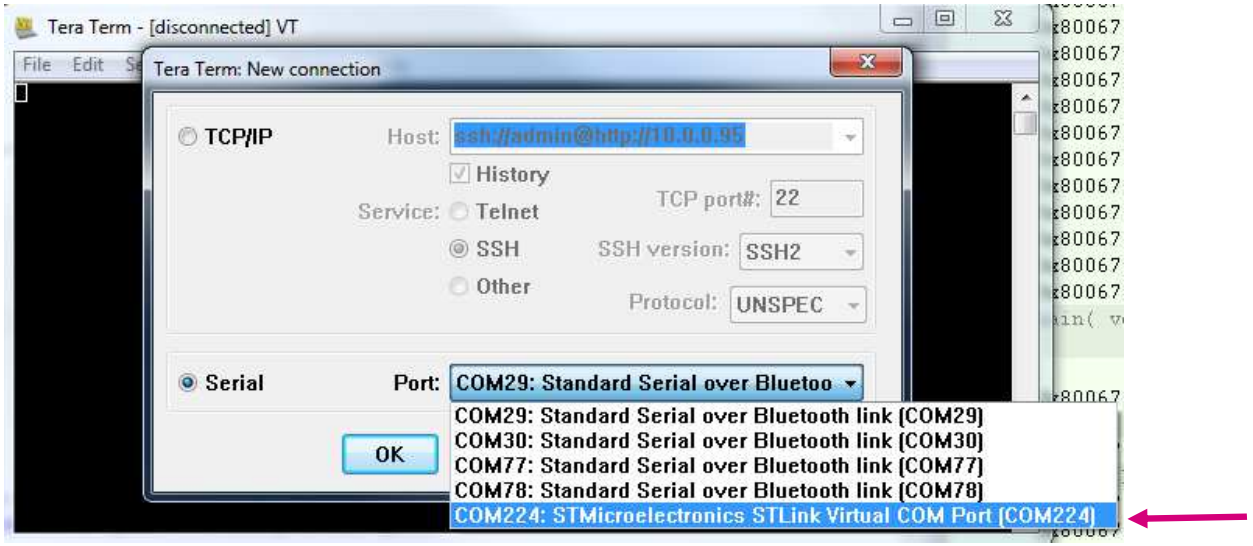
- Modify your BLE device name (line# 819 of app_ble.c)

```
const char *name = “BLE-CRS-01";
```

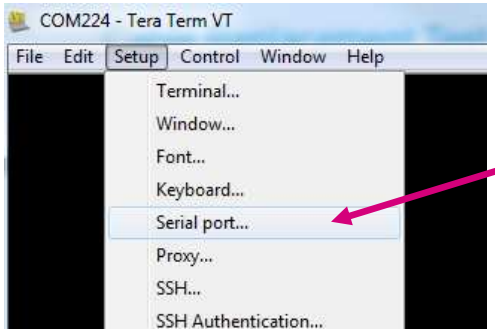
- Ensure that the BLE device name length in ASCII chars matches (line# 165 of app_ble.c)

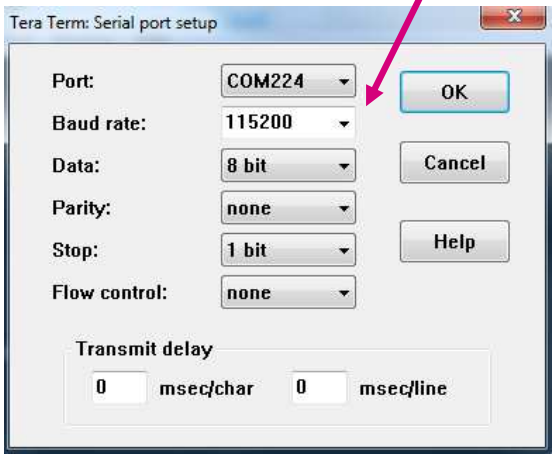
```
#define APPBLE_GAP_DEVICE_NAME_LENGTH 10
```

- Build and Run the project
- Connect your TeraTerm to the Nucleo’s STLink Virtual COM port

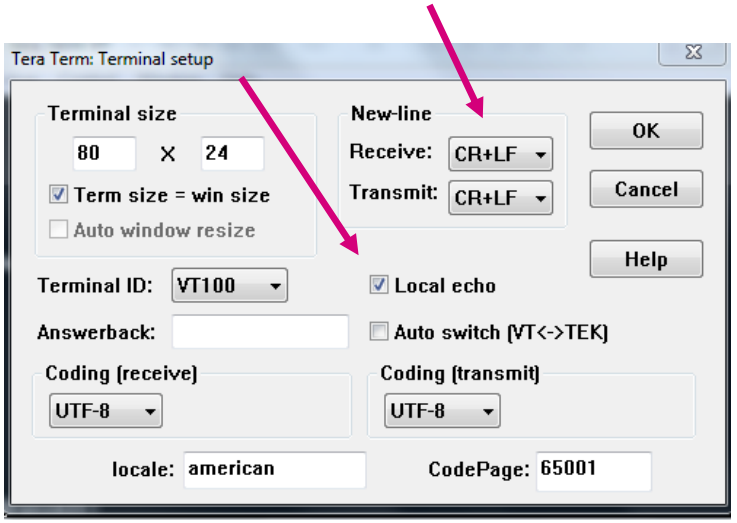


Configure your Serial port for 115,200bps / N / 8 / 1



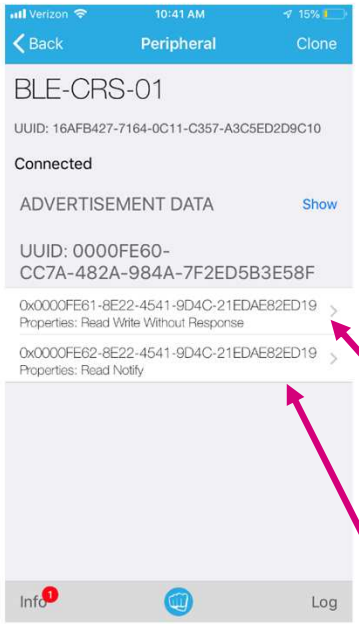


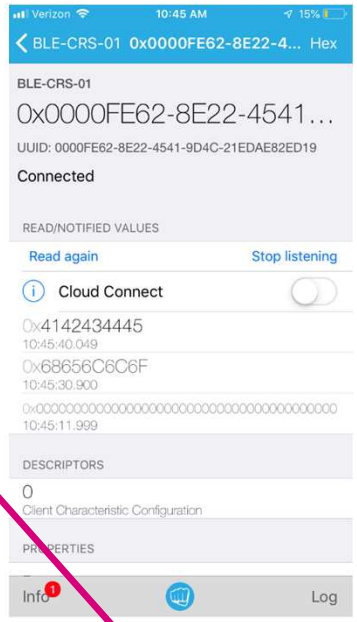
Configure Terminal Setup

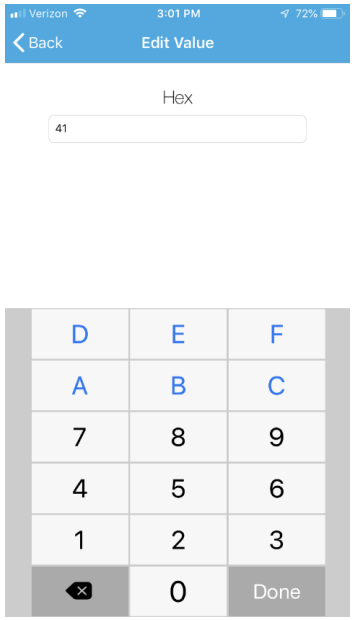


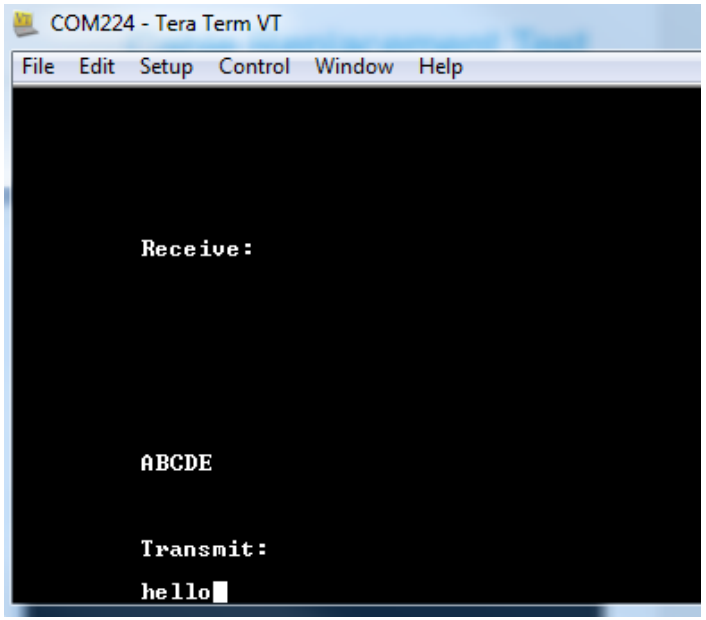
Cable Replacement Test

- Connect to your device with LightBlue Explorer
- Send and receive ASCII-based messages using the different characteristics









Write values to Nucleo

Enable Notifications to receive messages from Nucleo

STM32 WB

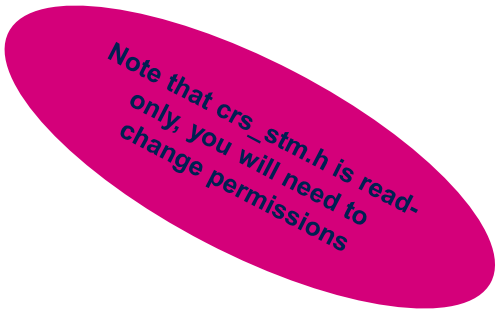
Add a custom characteristic to an existing Service

- Add the UUID definition (line# 74 of ble_conf.h)

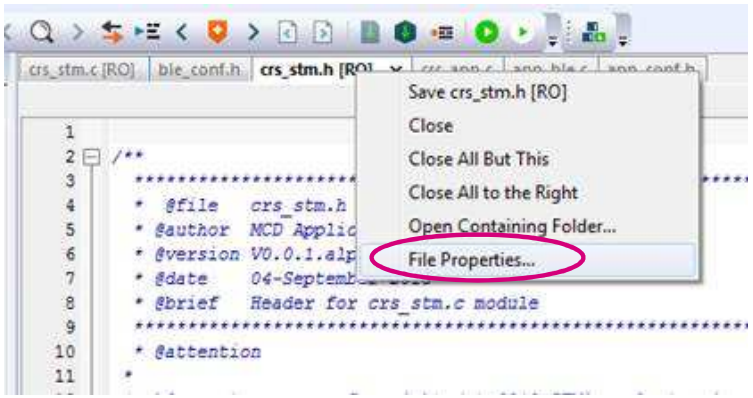
```
#define STM_LED_UUDI128    0x00, 0x00, 0xfe, 0x64, 0x8e, 0x22, 0x45, 0x41, 0x9d, 0x4c, 0x21, 0xed,
0xae, 0x82, 0xed, 0x19
```

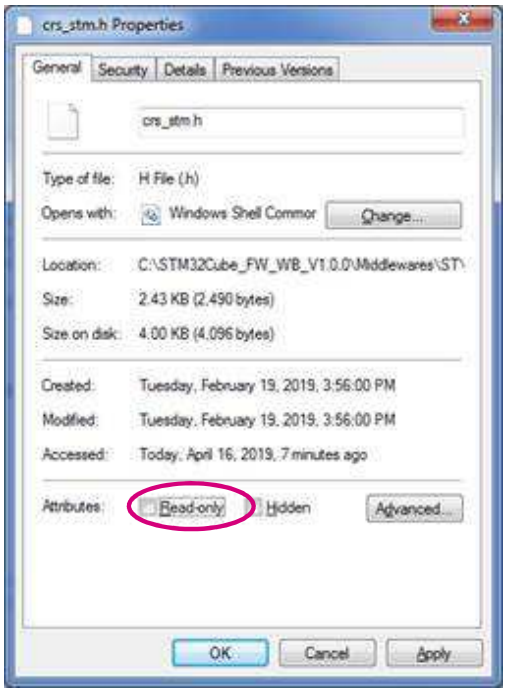
- Add event element (line# 37 of crs_stm.h)

```
typedef enum {
   STM_LED_WRITE_EVT,
   CRS_NOTIFY_ENABLED_EVT,
…
} CRS_Opcode_evt_t;
```



- From IAR, right click on the file tab and select “File Properties”
- Uncheck the “Read-only” box
- Click OK





life.augmented

STM32 WB

- Add characteristic handle (line# 32 of crs_stm.c)

```
typdef struct {
  …
  uint16_t CRSRXCharHdle;
  uint16_t LedWriteClientToServerCharHdle;
} CRSContext_t;
```

Note that crs_stm.c is read-only, you will need to change permissions

- Check for the handle (line# 122 of crs_stm.c)

```
case EVT_BLUE_GATT_ATTRIBUTE_MODIFIED:
{
  attribute_modified = (aci_gatt_attribute_modified_event_rp0*)blue_evt->data;
  if(attribute_modified->Attr_Handle == (CRSContext.LedWriteClientToServerCharHdle + 1))
  {
    Notification.CRS_Evt_Opcode = STM_LED_WRITE_EVT;
    Notification.DataTransfered.Length = attribute_modified->Attr_Data_Length;
    Notification.DataTransfered.pPayload = attribute_modified->Attr_Data;
    CRSAPP_Notification(&Notification);
  }
```

- Add uuid array (line# 193 of crs_stm.c)

```
uint8_t led_uuid[]     = { STM_LED_UUDI128 };
```

- Change the Max_Attribute_Records parameter (line# 215 of crs_stm.c)

```
hciCmdResult = aci_gatt_add_service(
                                UUID_TYPE_128,
                                (Service_UUID_t *) &uuid,
                                PRIMARY_SERVICE,
                                8,
                                &(CRSContext.SvcHdle));
```

- Add LED characteristic (line# 281 of crs_stm.c)

```
COPY_CRS_UUID(uuid.Char_UUID_128, led_uuid);
hciCmdResult = aci_gatt_add_char(CRSContext.SvcHdle,
                                 UUID_TYPE_128,
                                 &uuid,
                                 2,   /* Char_Value_Length */
                                 CHAR_PROP_WRITE_WITHOUT_RESP,
                                 ATTR_PERMISSION_NONE,
                                 GATT_NOTIFY_ATTRIBUTE_WRITE,/* gattEvtMask*/
                                 10, /* encryKeySize */
                                 1,  /* isVariable */
                                 &(CRSContext.LedWriteClientToServerCharHdle));
```

- Add event action (line# 194 of crs_app.c)

```
case STM_LED_WRITE_EVT:
      if(pNotification->DataTransfered.pPayload[0] == 0x01)
      {
        BSP_LED_On(LED_BLUE);
      }
      if(pNotification->DataTransfered.pPayload[0] == 0x00)
      {
        BSP_LED_Off(LED_BLUE);
      }
      break;
```

AN5185: Firmware Update Services

AN5185 details the sequence to create your own secure stack loader project, running on the M4

- Command / Response HCI event transactions to the M0+ similar to BLE

FUS commands

FUS uses same commands/response structure as wireless stacks and based on HCI model. FUS uses a subset of the HCI commands, namely:

- Vendor specific HCI command packet: used to send command from Cortex®-M4 to Cortex®-M0+.
- HCI command complete event packet: used to send response from Cortex®-M0+ to Cortex®-M4
- Vendor specific HCI event packet: used to send asynchronous events from Cortex®-M0+ to Cortex®-M4.

Figure 6. FUS HCI subset

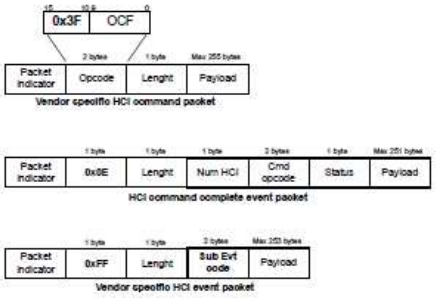

Figure 5. IPCC channels used by FUS

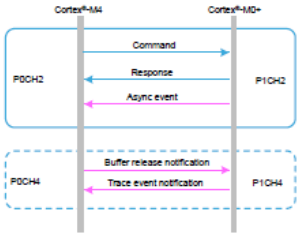
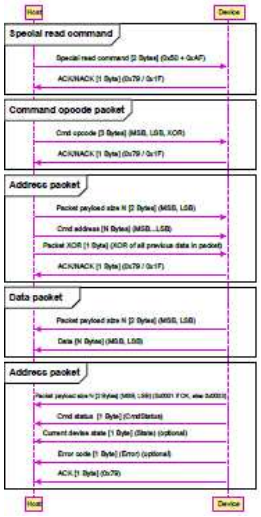


Also details on the bootloader sequences used

Figure 10. USART special read command



STM32 system bootloader extension for FUS

A command set extension has been added to STM32WB system bootloader in order to support FUS operation. These commands are implemented on USART and USB-DFU interfaces and follow the same rules as existing standard bootloader commands.

In order to help to understand this section, a prior reading of *STM32 microcontroller system memory boot mode* (AN2606) and *USART protocol used in the STM32 bootloader* (AN3155) and *USB DFU protocol used in the STM32 bootloader* (AN3156) documentation is required.

STM32 WB

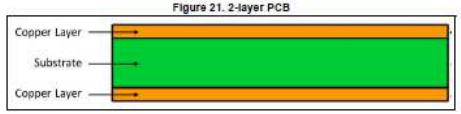
AN5165 details RF hardware considerations

- PCB stackup recommendations
- RF Front-end (discrete or IPD-based)
- SMPS passives selection
- Clocks

2-layer PCB

With the 2-layer PCB (see *Figure 21*), the RF signals and routing are on the top layer while the bottom layer is used for grounding under the RF zones, and for routing in others parts. The ground plane must be continuous under the RF zones, otherwise the return path current can increase and degrade the RF performance.

Figure 21. 2-layer PCB

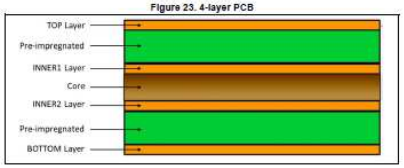


4-layer PCB

With the 4-layer PCB shown in *Figure 23*, it is recommended to have the following distribution:

- TOP layer: RF signal and routing on the top layer.
- INNER1 layer: grounding under the RF zones, routing in the others parts.
- INNER2 layer: power and low frequency routing.
- BOTTOM layer: low frequency routing.

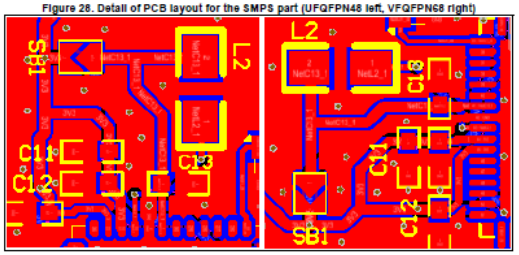
Figure 23. 4-layer PCB



6.1.2 SMPS

In addition to the recommendations given in *Section 4.3: SMPS*, to avoid important current loop when the STM32WB is in SMPS mode, it is recommended to place C11, C12 and C13 as close as possible to their respective pins on STM32WB. Do not forget to connect the solder pad to ground to have a strong current return path.

Figure 28. Detail of PCB layout for the SMPS part (UFQFPN48 left, VFQFPN68 right)



8 UFQFPN48/VFQFPN68 reference boards with IPD

The goal of the IPD (integrated passive device) is to replace the discrete matching network plus the integrated low-pass filter keeping equivalent TX/RX performance. *Figure 41* shows the differences between the two approaches.

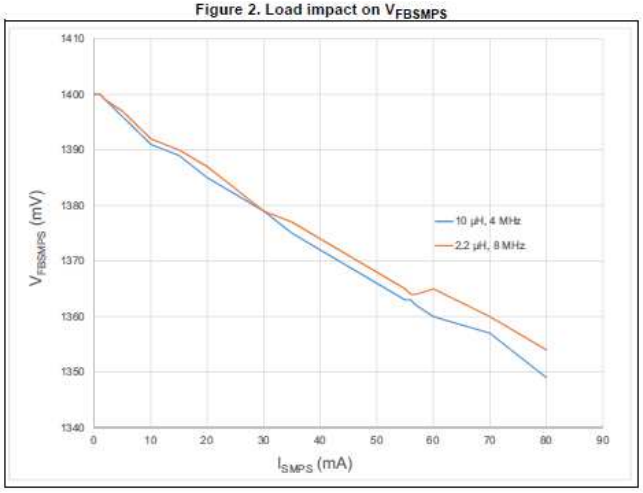
Usage of SMPS on STM32WB Series microcontrollers

Introduction

This document describes how the use the SMPS (switched mode power supply) integrated in microcontrollers of the STM32WB Series. It is intended to be used by system architects and by HW and board-level SW developers.

The patented implementation detailed in this document differs from the standard ones because it is able to maintain the RF transceiver full performance while, at the same time, providing the best power figure in burst application like those generally used by Bluetooth® Low Energy and IEEE 802.15.4 protocols.

Figure 2. Load impact on V_{FBSMPS}



Inrush current at power ON

As the SMPS starts in BYPASS mode when powering up, the bulk capacitance needs to be powered when V_{DD} rises. At start up, when the V_{DD} voltage enters the 0.7 to 1 V range, the SMPS PMOS starts to conduce and V_{FBSMPS} follows V_{DDSMPS}. This leads to a temporary inrush current that can be as high as 1.1 A if the power supply is strong enough.

Figure 4. Typical inrush current at power-on
