

Hi. All!

I want to use FSMC module, but I'm not sure that it settings correct. There is write operation on a picture. I see multiple NWE activation. And sometime it release NEx together NWE (should be NWE and than NEx). What should I do for diagram like Figure 437 from [RM0090](#) ? Or, possible, I don't understand something?

Code:

```

typedef struct
{
    __IO uint8_t data;
} Modem_TypeDef;
#define MDATA ((uint32_t)(0x60000000))
#define MADDR ((uint32_t)(0x60000000 | 0x100))
#define M_DATA ((Modem_TypeDef *) MDATA)
#define M_ADDR ((Modem_TypeDef *) MADDR)

{
initFSMC();
    while(1)
    {
        GPIO_WriteBit( GPIOE, GPIO_Pin_0, Bit_SET); //my own strobe
        M_DATA->data = 0x77;
        M_ADDR->data = 0x33;
        GPIO_WriteBit( GPIOE, GPIO_Pin_0, Bit_RESET); //my own strobe
    }
}

void initFSMC( void)
{
    // --- initialization FSMC ---
    RCC_AHB1PeriphClockCmd(RCC_AHB1Periph_GPIOD | RCC_AHB1Periph_GPIOE, ENABLE); //clock for FSMC
    RCC_AHB3PeriphClockCmd( RCC_AHB3Periph_FSMC, ENABLE);

    // configure GPIOE [4:8]
    gpio.GPIO_Mode = GPIO_Mode_AF;
    gpio.GPIO_OType = GPIO_OType_PP;
    gpio.GPIO_Pin = GPIO_Pin_7 | GPIO_Pin_8 | GPIO_Pin_9 | GPIO_Pin_10 | GPIO_Pin_11;
    gpio.GPIO_PuPd = GPIO_PuPd_UP;
    gpio.GPIO_Speed = GPIO_Speed_25MHz;
    GPIO_Init( GPIOE, &gpio);

    // configure GPIOD [0,1,4,5,7,14,15]
    gpio.GPIO_Mode = GPIO_Mode_AF;
    gpio.GPIO_OType = GPIO_OType_PP;
}

```

```

gpio.GPIO_Pin = GPIO_Pin_0 | GPIO_Pin_1 | GPIO_Pin_4 | GPIO_Pin_5 | \
GPIO_Pin_7 | GPIO_Pin_14 | GPIO_Pin_15;
gpio.GPIO_PuPd = GPIO_PuPd_UP;
gpio.GPIO_Speed = GPIO_Speed_25MHz;
GPIO_Init( GPIOD, &gpio);

// timings
