

I have STM32F412G-Discovery board. When the icons appear for the start of the corresponding module. All modules work. You can add and remove them. I decided to make a module using SWIPELIST widget. It works and scrolls. But when it comes to event press exit button, the program goes to HardFault. The remaining modules are normally closed.

```
#include "dialog.h"
#include "k_module.h"
#include "information_res.c"
#include "SWIPELIST.h"
```

```
static void Startup(WM_HWIN hWin, uint16_t xpos, uint16_t ypos);
```

```
K_ModuleItem_Typedef INFORMATION_board = { 4, (uint8_t*)"", &bmImageMenuConfig_96x96,
Startup, };
```

```
#define ID_FRAMEWIN_INFO      (GUI_ID_USER + 0x01)
#define ID_SWIPELIST_0        (GUI_ID_USER + 0x02)
```

```
#define ID_RADIO_0            (GUI_ID_USER + 0x03)
#define ID_CHECK_0           (GUI_ID_USER + 0x04)
```

```
#define NUM_SEPARATORS 3      // Number of available separators
```

```
#define NUM_ITEMS 5          // Number of available items
```

```
static const char * paItemText[3][5] = {

}

```

The most interesting is that when I comment the code the program works as it should, only SWIPELIST widget remains blank

```

/*for (j = 0; j < NUM_SEPARATORS; j++) {
    SWIPELIST_AddSepItem(hItem, paSeperatorText[j], 48);
    for (i = 0; i < NUM_ITEMS; i++) {
        SWIPELIST_AddItem(hItem, paltemText[j][i], 48);
    }
}*/
/*for (i = 0; i < 5; i++) {
    hItem1 = CHECKBOX_Create(0, 0, 32, 32, WM_HBKWIN, 0, WM_CF_SHOW);
    SWIPELIST_ItemAttachWindow(hItem, 1 + i, hItem1, 190, 8);
}*/

```

I tried this code on STM32F207VGT6_MIKROMEDIYA. It all works. The windows are created equally. But STM32F412G-Discovery hangs when you press the EXIT. The code window Call STM32F207VGT6_MIKROMEDIYA

```
void StartDefaultTask(void const * argument)
{
    GUI_Init();

    while(1)
    {
        switch(appState){
        case MAIN:
            hWin = CreateWindowMAIN();
            appState = GUI_ExecCreatedDialog(hWin);
            break;
        case PLAYER:
            hWin = CreateWindowPLAYER();
            appState = GUI_ExecCreatedDialog(hWin);
            break;
        case RECORD:
            hWin = CreateWindowRECORD();
            appState = GUI_ExecCreatedDialog(hWin);
            break;
        case FOLDER:
            hWin = CreateWindowFOLDER();
            appState = GUI_ExecCreatedDialog(hWin);
            break;
        case SETTING:
            hWin = CreateWindowSETTING();
            appState = GUI_ExecCreatedDialog(hWin);
            break;
        default:
            break;
        }
    }
}
```

I tried in different ways. In some cases, the window appears on the scrolling ICONVIEW (ie, the window moves and gets out of the side ICONVIEW). In some cases, after clicking on the exit window remains, and after him there ICONVIEW (and continues to work correctly, you can still run 20 times this module and freezes .. memory ends). The feeling that is inherited is not correct or parent loses. With other widgets such is not present (at least with simple widgets). How do SWIPELIST to work properly?
